COOLING HEATING HOT WATER

i-KI MTD / i-KIR MTD

COMPLETE CONTROL with nadisystem

HFC R-410A

0031
9,55 kW

Reverse-cycle or heating only unit with DC inverter-driven compressor, for hot water production up to 60°C and operation at outside air temperatures down to -20°C. Priority domestic hot water production.

(The photo of the unit is indicative and may change depending on the model)

- DC inverter-driven compressor
- High efficiency
- Adaptability
- Silent operation
- Heat pump function
- Hot water production

1. DESCRIPTION OF THE UNIT

High efficiency range
The i-KI heating only and i-KIR reverse-cycle heat pumps feature high seasonal efficiency in both heating and cooling mode, using DC inverter technology to modulate compressor operation and deliver the exact amount of energy based on the actual needs of the building.
This excellent result has been achieved by carefully sizing all the components. Special attention has been paid to all heat exchange surfaces and the fans.
The use of newly designed condensing coils, with larger surfaces and special layout, new asymmetrical evaporators with better and more efficient refrigerant distribution, both in the liquid and gas phase, and high efficiency fans are some of the important innovations included with this product.
Careful sizing of the systems this series of units are used with can mean significant savings in energy consumed and consequently a major reduction in running costs.

Smart Defrost
The heat pumps come with an innovative and patented self-adaptive defrost system that optimises defrost times, improving overall unit efficiency.
The strength of this new logic is the ability to automatically adjust parameters used by the algorithms in each cycle, based on the outside conditions.
Controlling the evaporation pressure, outside air temperature and defrost time, give an excellent estimate of ice on the coil, thus guaranteeing an effective and efficient defrost cycle.

Air-water heat pump
Air-to-water heat pump, available in heating only and reverse-cycle versions.
Unit supplied complete with non-freezing oil and refrigerant charge, and factory tested. Only water and electrical connections are required on site. Unit charged with R410A ecological refrigerant.

COMPOSITION OF STANDARD UNIT
Structure
Structure made from hot galvanised steel load-bearing base and panels, painted with polyester power coat. The load-bearing structure that holds together and supports the main components is designed to guarantee maximum access for service and maintenance.

Compressor
Inverter-driven DC brushless hermetic rotary compressors, complete with thermal protector.

Utility-side heat exchanger
Braze welded AISI 316 steel plate heat exchanger. The heat exchangers are lined on the outside with a layer of closed-cell neoprene to prevent condensation.

Source-side heat exchanger
Finned coil heat exchanger made from copper tubes and aluminium fins, spaced apart so as to guarantee maximum heat exchange efficiency. The unit is fitted as standard of the tray condensate drain.

Electric frost protection heater for the base
Modulating electric frost protection heater for the base, positioned between the finned heat exchanger and the base to improve and assist drainage of water during defrosts.

Fans
Axial-flow fans with DC brushless motor, external impeller, with pressed plate blades, housed in aerodynamic tubes with accident prevention grill. Fans with continuous speed control by pressure transducer.

Refrigerant circuit
Main components in the refrigerant circuit:
- refrigerant R410A
- electronic thermostatic valve,
- liquid receiver,
- 4-way reversing valve.

Heat pump electrical panel:
- Compressor discharge temperature probe
- Outside air temperature probe
- Defrost temperature probe
- Compressor suction temperature probe
- Heat exchanger water inlet temperature probe
- Heat exchanger water outlet temperature probe
- Board with alarm signal display and dipswitches
- Inverter board
- Power module
- Board protection fuses

Inside module electrical panel:
- Radio interference suppresser
- Controller/unit interface
- Electronic controller
- Unit ON/OFF relay
- Outlet heater / boiler relay
- Alarm/secondary pump/dehumidifier relay
- Heat/cool relay
- Auxiliary circuit protection fuse
- Controller protection fuse
- Interface protection fuse

The water circuit is completed by:
- 3-speed pump
- Expansion vessel (8 litres)
- Safety valve (3 bar)
- Pressure gauge
- Vent valve

VERSIONS AVAILABLE

i-KI MTD air/water heat pump, heating only, with DC inverter-driven compressors, domestic hot water production, axial-flow fans and hydronic unit.

i-KIR MTD reverse-cycle air/water heat pump with DC inverter-driven compressors, domestic hot water production, axial-flow fans and hydronic unit

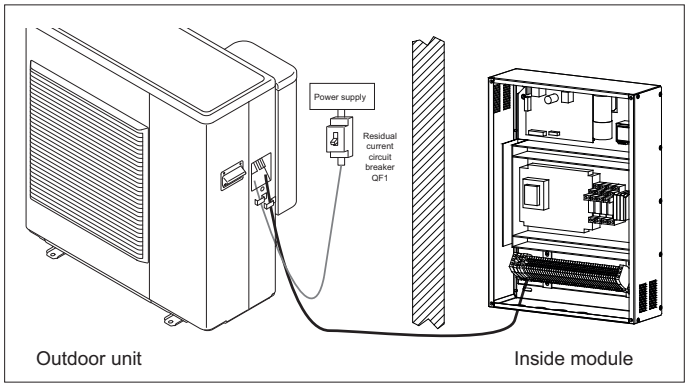
The heat pump consists of:

REVERSE-CYCLE heat pump	i-KIR 0031m MTD	Outdoor unit
	i-EMR	Inside module

HEATING ONLY heat pump	i-KIR 0031m MTD	Outdoor unit
	i-EM	Inside module

The inside module is installed inside the building's equipment room and is electrically connected to the outdoor unit, installed outside.

Connection example:



The remote room controller, outside air temperature probes, supplementary electric heater or boiler, expansion modules and all other accessories required by the system must only be connected to the inside module. This avoids having to run numerous cables to the outside, simplifying unit installation.

SUPPLIED AS STANDARD

- N-THC remote control complete with backlit display, temperature probe, humidity probe, knob and 4 buttons (must be installed)
- Outside air temperature probe for climate compensation (must be installed)
- Domestic hot water probe
- Storage tank probe

ACCESSORIES

- N-THC wired room timer thermostat with backlit display, complete with temperature and humidity probe for system configuration.
- N-EM1 expansion module for system configuration.
- 3-way selector valve for domestic hot water production.
- Supplementary electric heater for the heating system.
- DHW storage electric heater, as supplementary heat source and for Legionella prevention.
- N-CM kit for managing heat pumps in cascade.
- N-RS RS485 serial card for ModBus protocol.
- Low-loss header, 35, 100 or 200 litres.
- Domestic hot water cylinder, 300 or 500 litres.
- Domestic hot water storage tank, 300 litres, to be combined with the DOMH2O instant domestic hot water production kit.
- Domestic hot water storage tank, 300, 500 and 1000 litres with solar heating coil, to be combined with the DOMH2O instant domestic hot water production kit.
- DOMH2O15 and DOMH2O24 instant domestic hot water production kit.

2. ELECTRONIC CONTROLLER

The NADISYSTEM electronic controller is based on an innovative and efficient approach to building air-conditioning.
Energy is only consumed when necessary and the energy sources are used based on availability, efficiency and cost, giving priority to renewable sources, where available.
The first significant advantage of introducing a single integrated control system is optimisation of energy savings through coordination between the different system components, eliminating inefficiencies in communication, simplifying installation and reducing the number of controllers.
NADISYSTEM ensures dynamic control of water outlet temperature according to real needs in the building and the outside air temperature, optimising comfort and reducing wasted energy.
The remote keypad supplied with the unit can be used to freely set the room temperature, humidity, operating mode, domestic hot water production and operating times for each zone.
The NADISYSTEM control system for residential applications gives high operating flexibility by controlling the secondary circuits, that is, activating zone pumps and valves depending on the room temperature set on the remote keypad, and by controlling mixing valves to ensure the correct water temperature in radiant systems according to the climate conditions set for each circuit.
There are 15 different types of pre-configured system for quick and easy installation, with the possibility to manage up to 5 remote keypads for controlling thermal load in likewise zones.
The advanced PRANA controller also allows integration of solar panels for the domestic hot water production, giving priority to direct solar energy, if available, and increasing the use of renewable sources while also managing traditional sources, such as electric heaters or boilers.
The controller can manage up to four 4 heat pumps connected in cascade to increase capacity in applications with multiple occupied areas, such as hotels, schools, apartment blocks, offices and shopping centres.
The units are managed in master-slave mode, with the master unit responsible for processing the information and sending it to the slave units.
This ensures fine control over the capacity delivered, without decreasing performance, and more precise system sizing.
NADISYSTEM can determine how many cascaded units are needed to guarantee domestic hot water production, all or just one, according to requirements.
The controller also balances compressor operating hours based on time logic, activating the units in rotation, and where necessary excluding any units that are momentarily out of service, without interrupting operation of the cascade as a whole.
Moreover, the controller modulates fan operation for optimum condensation or evaporation, depending on the operating mode, allowing domestic hot water production even in summer with outside temperatures up to 45°C, and reducing noise at night.
NADISYSTEM also allows easy service, being interfaceable to supervision systems for remote maintenance by specialist technicians, as well as remote control of certain functions, such as:
la remotazione di alcuni comandi come:
- on/off
- cooling/heating operation
- heating system/domestic hot water priority
- shutdown due to electricity rate

Main functions

- Wired remote keypad with backlit display, complete with temperature and humidity probe
- Calculation of dew point and increase in water outlet temperature for underfloor systems, possibility to enable a dehumidifier
- Operating parameters with dedicated user and installer menus to configure the type of system
- Weekly timer for setting 6 daily time bands
- Outside air temperature probe to control the system water temperature set point based on heating and cooling compensation curves. Fixed point operation also available.
- Cooling, heating operating modes, automatic mode changeover
- Domestic hot water production
- Supplementary electric heater management for domestic hot water storage and Legionella prevention cycle
- Domestic hot water recirculation by timer or flow switch
- External resource (boiler or electric heater) management as supplementary or sole source of heat
- Cascaded management of up to 4 heat pumps
- Different systems solutions by configuring the controller and using dedicated expansion modules (accessories), up to 5 zones with the possibility to control different temperature according to the selected compensation curves.
- Alarm signals
- Frost protection management based on inside or outside air temperature or water temperature, to protect the system pipes and heat exchangers inside the unit.

3. OPERATING CHARACTERISTICS

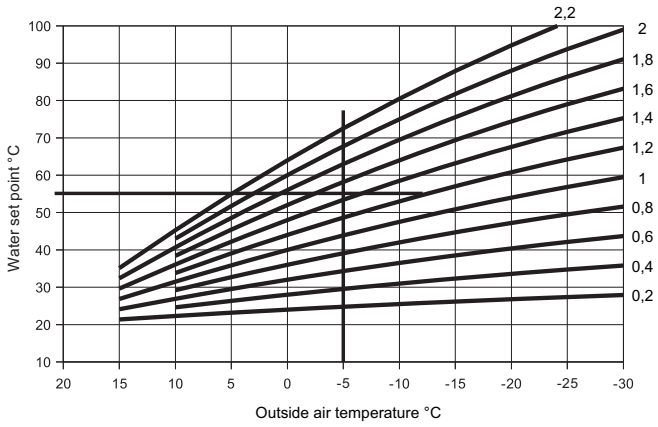
HIGH EFFICIENCY AND REDUCED CONSUMPTION

The i-KI and i-KIR reverse-cycle air-to-water heat pump is fitted with DC inverter-driven compressor and EC fan with low energy consumption.
Inverter technology continuously controls compressor speed to ensure perfect adaptation to system load, modulating the heating or cooling capacity delivered and consequently reducing power consumption and achieving the highest seasonal coefficients currently available on the market.
The seasonal coefficient of performance faithfully reflects the advantages in energy and economic terms of using the heat pump all year around, being the ratio between energy delivered and power consumed. In terms of improving performance and reducing power consumption, the electronic thermostatic valve is an important component that maximises system efficiency.
Quick and effective adaptation by the electronic thermostatic valve to variations in load allows the compressor to always work at optimum efficiency, as well as extending compressor life.

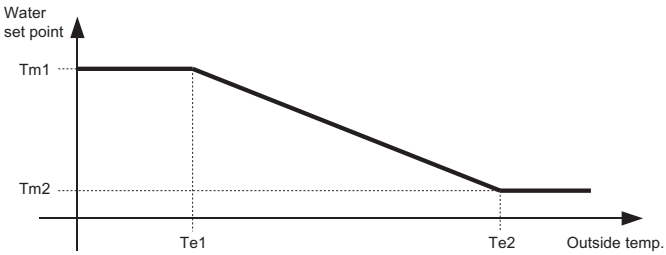
TEMPERATURE CONTROL

The water temperature delivered to the heating and cooling circuit is calculated by the controller and depends on the selected cooling and heating compensation curve.
A building's thermal requirements do not remain constant throughout the day or the year, but rather increase or decrease based on the outside air temperature.
It's therefore a waste of energy to keep the water at a constant temperature. Delivering water at different temperatures to the terminals based on the outside air temperature achieves high seasonal efficiency ratios and brings considerable savings in running costs.
The compensation curve in heating and cooling mode can be adjusted to allow correct heat pump operation according to the system (radiant panels, radiators, fan coils).
Example: Selecting heating curve 1.4 with an outside air temperature of -5°C gives a water temperature of +55°C.
Dedicated compensation curves can be set for each zone, depending on the type of terminal unit, or alternatively a fixed point temperature can be selected.
A function called "room temperature influence" is available to quickly adapt the water temperature by modifying the compensation curve when the indoor conditions change, for example when there are more occupants in the room.
This function is only available in heating mode.
In cooling operation during summer, the controller calculates the dew point using temperature and humidity probe on the remote terminal, which determines an increase in the water temperature to deliver to the radiant system and activation of the dehumidifier (one dehumidifier contact only for all zones).

Heating compensation curve

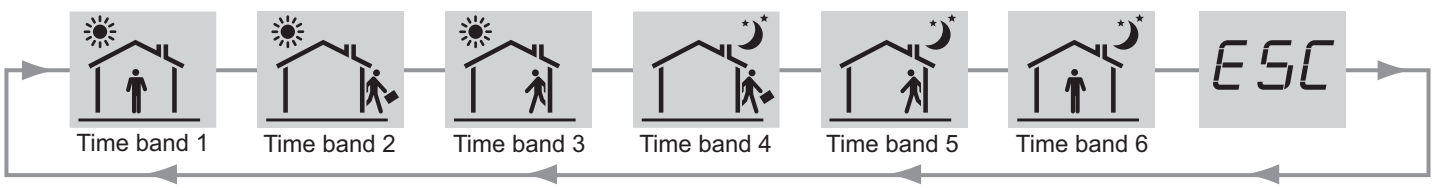


Cooling compensation curve



PROGRAMMING THE TIME BANDS

A timer is available to customise differentiated activation and deactivation for each individual zone of the system, creating an operating profile with up to 6 daily time bands.



SYSTEM PUMP OPERATION

When reaching the system water temperature set point, the compressor stops and the system pump is activated periodically, so as to minimise energy consumption and ensure correct measurement of the water temperature. The pump on and off times can be set using a parameter, according to the type of system.
In systems with fan coils, the time between one sniffing cycle and the next should be reduced in order to avoid excessive cooling of the water, in heating operation, and if and if the system water content is equal to the minimum value shown in the paragraph on “Minimum and maximum system water content”.

DOMESTIC HOT WATER PRODUCTION

The controller manages domestic hot water production using a 3-way valve installed outside of the unit, deviating the flow of hot water to the DHW storage tank, which must be suitably sized according to the type of usage.
Production is enabled when the water temperature inside the DHW storage tank (probe BT8) is less than the DHW set point.
The production of domestic hot water is guaranteed in both summer and winter, according to the operating limits shown in this manual. If heat pump operation is expected outside of the limits, consider using a supplementary source of heat, managed directly by the controller.
An electric heater should be installed inside the DHW storage tank to ensure the temperature does not fall below 10°C in the event of extended periods of heat pump inactivity (standby).

LEGIONELLA PREVENTION FUNCTION

The Legionella prevention function ensures the elimination of the Legionella bacteria that reside in domestic water storage tanks. The temperature and duration of the Legionella prevention cycles to eliminate bacteria are typically:

- 2 minutes > 70°C
- 4 minutes > 65°C
- 60 minutes > 60°C

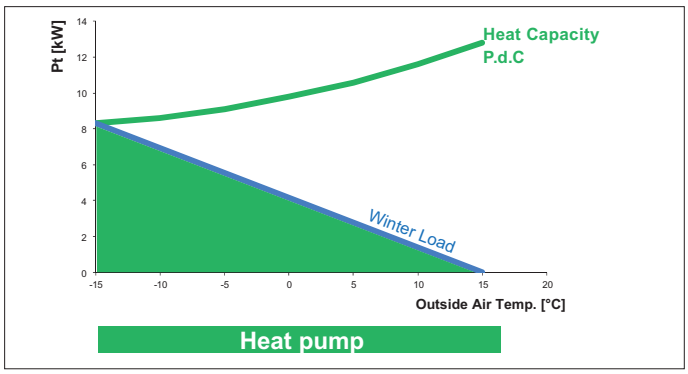
The Legionella prevention cycles are managed directly by the controller, enabling the heater in the domestic hot water storage tank domestic, with the possibility to set the duration, temperature, day and time.

AUXILIARY RESOURCES

System operation can be distinguished as monovalent, all-electric or bivalent. The controller can activate the external source to achieve one of the functions listed above.

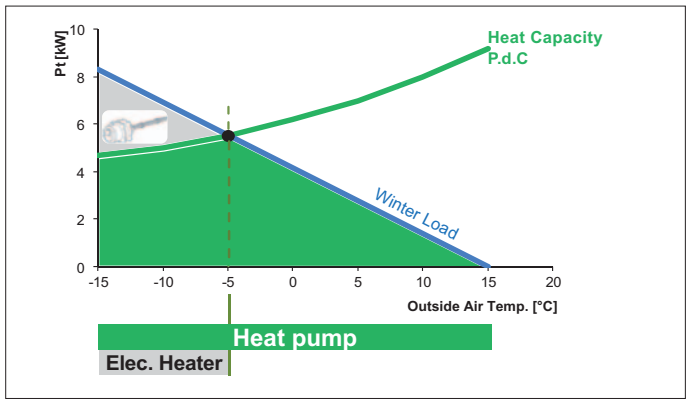
Monovalent operation

For monovalent operation, the heat pump has to meet the entire demand of the building. There may be excessive heating capacity of the heat pump above all when the outside air temperature is above zero, as well as high power consumption.
Make sure the home’s energy meter is correctly sized.
Solution suggested for new homes.



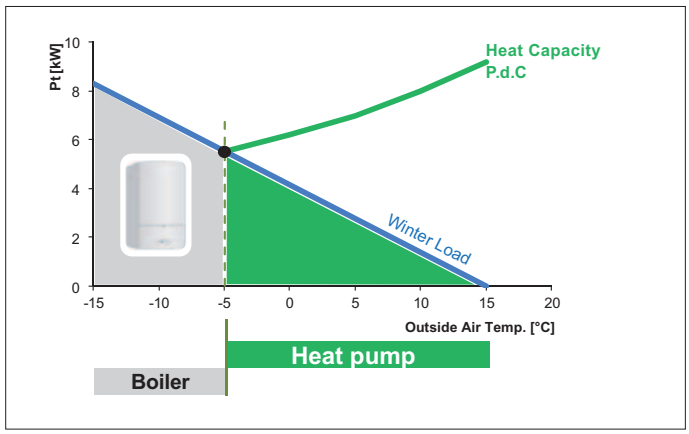
All-electric operation

In all-electric operation the heat pump is integrated with an electric heater to meet the entire demand of the building.
The electric heater is activated below certain outside temperatures so as to satisfy demand in the building that the heat pump cannot manage on its own.
Considering the reduced number of hours of heat pump operation at low outside temperatures during the winter period, operation of the supplementary heater will also be reduced, and consequently power consumption will be negligible.
Therefore the system’s seasonal energy efficiency remains unchanged.
This solution is suggested for new homes and lower investments than monovalent heat pumps.



Bivalent operation

In the case of bivalent operation the heat pump meets the needs of the building down to a certain outside temperature, called the bivalence point.
Below the bivalence point the heat pump switches off and only the auxiliary source (e.g. boiler) provides heat for the building.
This solution is ideal for traditional systems and renovations.



SYSTEM MANAGEMENT

The NADISYSTEM control system for residential applications gives high operating flexibility by controlling the secondary circuits, that is, activating zone pumps and valves depending on the room temperature set on the remote keypad, and by controlling mixing valves to ensure the correct water temperature in radiant systems according to the climate conditions set for each circuit.

There are 15 different types of pre-configured system for quick and easy installation, with the possibility to manage up to 5 remote keypads for controlling thermal load in likewise zones.

If the radiant system also needs to meet cooling demand, humidity control is guaranteed by activating the dehumidifier contact, while calculation of the dew point, measured by the N-THC controller, ensures the correct water outlet temperature defined by the cooling compensation curve, thus avoiding formation of condensate on the floor.

Remember to suitably insulate the pipes in contact with the air, if air-conditioning in used inn summer.

The following table indicates the different type of systems that can be controlled directly by the NadiSystem.

N. System Configuration	Remote Keypad N-THC	Expansion Module N-EM1	High Temp. Zone (ex. Radiator/ Fan Coil)	High Temp. Zone (ex. Radiator/ Fan Coil)	High Temp. Zone (ex. Radiator/ Fan Coil)	Low Temp. Zone (ex. Floor Heating)	Low Temp. Zone (ex. Floor Heating)	Low Temp. Zone (ex. Floor Heating)	DHW Recirculation
0	x1 standard								
1	x1 standard	x1							2	x1 standard	x1							
3	x1 standard + x1 optional	x1							
4	x1 standard + x1 optional	x2 							5	x1 standard + x3 optional	x2 							
6	x1 standard + x3 optional	x2 							7	x1 standard + x3 optional	x2 							

The controller can manage the valves in each individual zone or alternatively pumps, depending on the set temperature.
The system decides whether to activate the unit or the most energy efficient resources to meet demand.
NadiSystem manages different temperature levels based on the terminal units used.
The heat pump directly produces water at the right temperature for the system terminals connected to the high temperature circuits (e.g. fan coils, radiators, towel rails in bathrooms), while low temperature radiant panels are controlled by the mixing valves according to the specific compensation curves.
This means a compensation curve can be applied to the high temperature zones and different compensation curves for each low temperature zone (maximum three).
Depending on the type and complexity of the system, expansion modules are required for connection of the components managed by the system (pumps, valves, probes etc.), as indicated in the table.
Simple installation by serial connection of the components making up the NadiSystem.

N. System Configuration	Remote Keypad N-THC	Expansion Module N-EM1	High Temp. Zone (ex. Radiator/ Fan Coil)	High Temp. Zone (ex. Radiator/ Fan Coil)	High Temp. Zone (ex. Radiator/ Fan Coil)	Low Temp. Zone (ex. Floor Heating)	Low Temp. Zone (ex. Floor Heating)	Low Temp. Zone (ex. Floor Heating)	DHW Recirculation
8	x1 standard + x3 optional	x2							9	x1 standard + x1 optional	x2							
10	x1 standard + x1 optional	x2							11	x1 standard + x2 optional	x2							12	x1 standard + x3 optional	x3							13	x1 standard + x4 optional	x3							14	x1 standard + x2 optional	x3							
Key

- Mixing valve floor heating
- Circulation Zone pump or motorized valve
- Water probe
- DHW pump circulation
- Ambiente thermostat

* N.1 ambiente thermostat available with the heat pump
** Configurations from 4 to 14 are required additional N-THC as accessories

FROST PROTECTION

The frost protection function is active even when the heat pump is OFF.

DOMESTIC HOT WATER FROST PROTECTION STORAGE

The domestic hot water frost protection function is only active if an auxiliary resource is installed for the domestic hot water storage tank.
The additional heater is activated if the water temperature, measured by sensor BT8, is less than +5°C, and is deactivated at +8°C.

PRIMARY CIRCUIT FROST PROTECTION SYSTEM

The frost protection function is implemented by starting the system pump and, where featured, the electric heater outside of the unit when the water temperature water (measured by the heat exchanger outlet probe) is less than 4.5°C, and switching the same devices off when the water temperature reaches +7°C.

SECONDARY CIRCUIT FROST PROTECTION SYSTEM

The pumps on the system's secondary circuit are activated together with the primary pump, according to the criterion described in the previous paragraph.

FROST PROTECTION BASED ON OUTSIDE AIR TEMPERATURE

The system pump is activated according to the outside air temperature to prevent ice forming in the pipes.
The pump is activated if the outside air temperature is less than 4°C and deactivated when it rises back over 5°C.

FROST PROTECTION BASED ON INSIDE AIR TEMPERATURE

The heat pump and/or supplementary heat sources (outlet heater or boiler) are activated if the inside temperature falls below 14°C, to prevent the pipes inside the home from freezing.

ALARM SIGNALS

Correct unit operation and any alarms are displayed on the room thermostat, the latter by the symbol.
The diagnostics functions include complete alarm management, with an alarm log (via service keypad) for more detailed analysis of unit behaviour.

4. ACCESSORIES

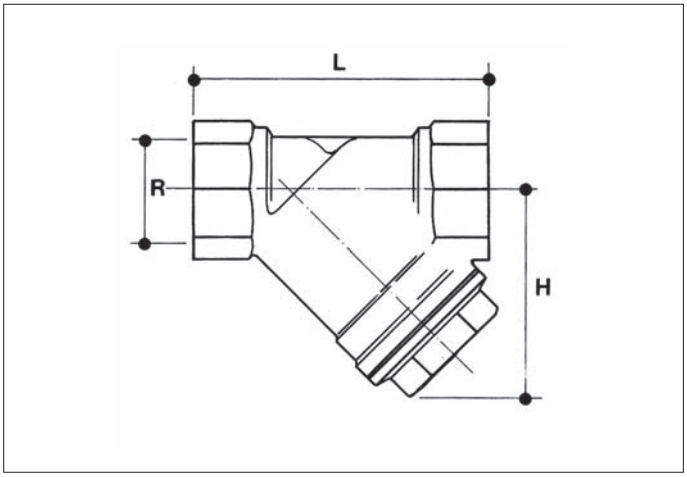
The accessories listed below are supplied separately.

METAL MESH WATER FILTER

This filter MUST be installed on the heat pump return pipe to trap any impurities in the water circuit that may damage the unit's heat exchanger.

Characteristics	
Body	Brass
Finish	Sanded
Body gasket	Betaflex 71
Thread	ISO 228/1
Filter	AISI 304 stainless steel micro-perforated sheet metal
Hole pitch	2 mm
Inscribed hole diameter	500 micron
Number of holes per cm^2	80

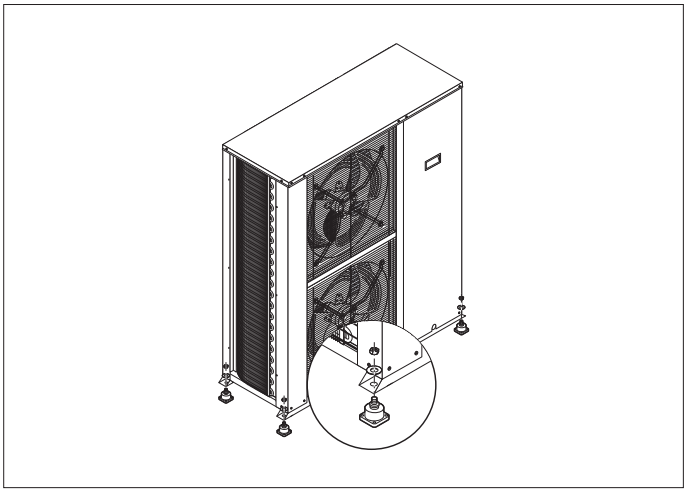
Dimensions				
DN		32	40	50
R	inch	1 1/4	1 1/2	2
L	mm	96	106	126
H	mm	68	75	90



Pressure drop				
R	inch	1 1/4	1 1/2	2
Kv		17	24,5	36

VIBRATION DAMPERS

Used between the heat pump and the support plane.
Vibration dampers made from rubber, elastomer and aluminium alloy casing for fastening to the floor.

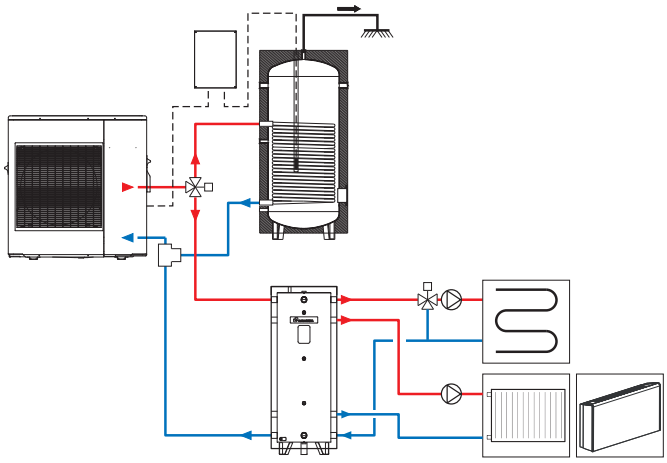


BT AND PT STORAGE TANKS

Storage tanks to be used in heating and cooling systems, to ensure minimum heat pump operating time in all operating conditions and avoid excessive starts and stops. It can also be used to isolate the water circuit from the heat pump and to partially meet energy demand during periods in which the unit is shutdown due to the electricity rate. For indoor installation.

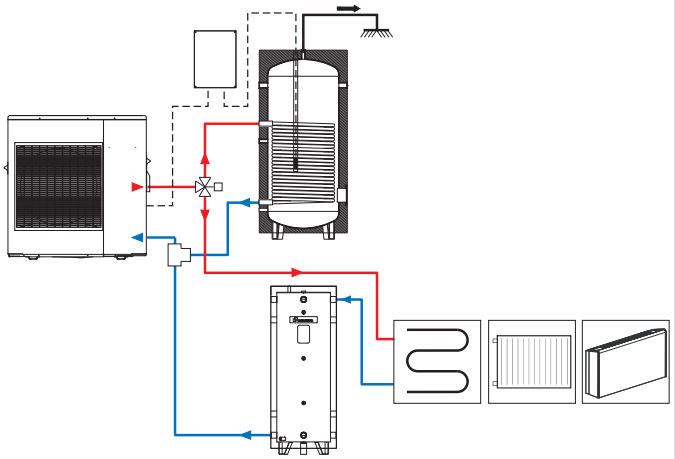
Models available	Volume
BT35	35 litres
BT100	100 litres
BT200	200 litres
TP300	300 litres

The diagram illustrates the use of the BT/TP storage tank as a low-loss header to separate the heat pump primary circuit from the secondary circuit to the terminal units.
This allows different flow-rates and temperatures to be managed depending on the type of terminal used.
Correctly sized, it guarantees the minimum water volume required by the heat pump.



The diagram shown is purely indicative.

The diagram illustrates the use of the BT/TP storage tank as a storage tank on the heat pump return pipe so as to increase the volume of water available in the system, avoiding excessive starts and stops.
In this case, make sure the available pressure head of the pump on the unit is sufficient to guarantee correct system operation.



The diagram shown is purely indicative.

Technical specifications

The storage tanks are made from carbon steel plate welded using the best technology and undergo strict water pressure tests (9 bars, allowing an operating pressure of 6 bars).

Being a container of water for heating and cooling, this product does not require internal treatment, while the outside is coated with rustproof paint.

The tanks are protected on the outside with a closed cell elastomeric foam lining, 50 mm thick, with soft blue PVC exterior finish, for models BT 100/200 and TP300; polyethylene foam insulation, 10 mm thick, with metallic exterior finish for models BT35.

Dimensions - Model BT35

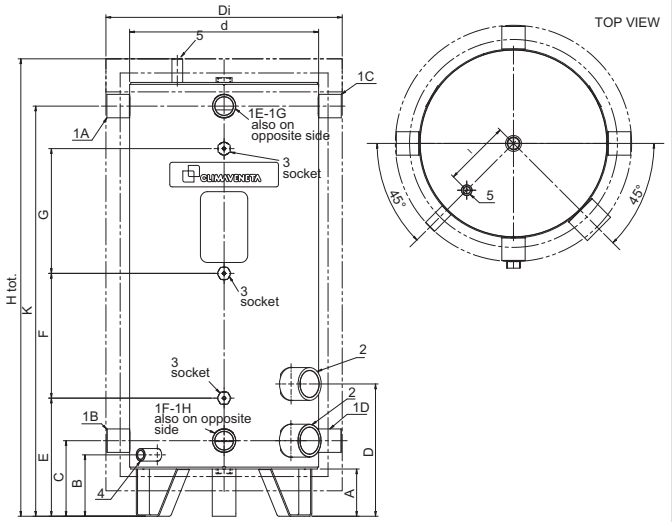
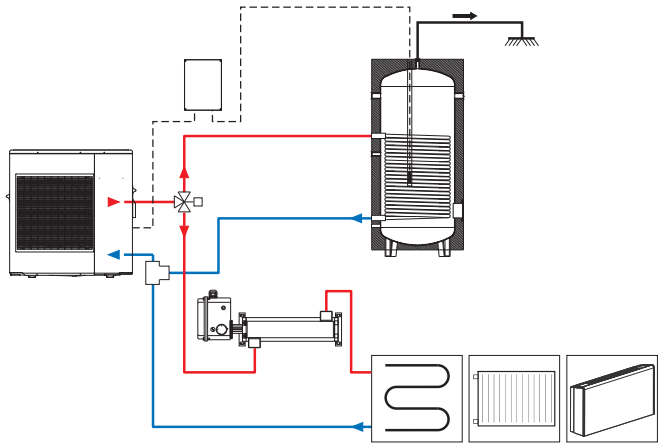
4	Drain/load
5	Vent

Dimensions - Model BT100, BT200, TP300



OUTLET ELECTRIC HEATER

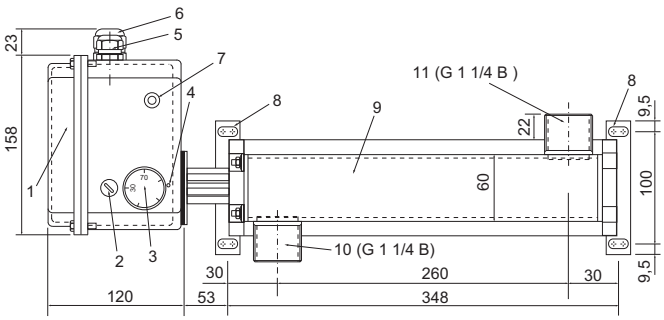
The outlet electric heaters are available with power ratings of 3 kW single-phase and 3, 6 and 9 kW three-phase.
Used on the system outlet, these guarantee the heating demand of the building at low outside temperatures by supplementing the heating capacity of the heat pump.
The electric heaters are deactivated as soon as the heat pump alone can meet heating demand.
Considering that normally the heat pump operates only a short time at low outside temperatures, operation of the supplementary heater is also reduced and consequently power consumption is negligible.
Therefore, the system's seasonal efficiency ratio remains unchanged.
Wall-mounted installation using the fastening brackets.



The diagram shown is purely indicative.

Technical specifications		
Power supply	230V/50Hz	400V/50Hz
Power	3000 W	3000-6000-9000 W
Maximum pressure	6 Bar	
Min/max operating temperature	5...90°C	
Safety thermostat	90 +/- 5°C	
Adjustable thermostat	30...70°C	
Heating element material	Incoloy 800	
Threaded attachment	1" 1/4 M GAS	
Index of protection	IP 55	
Indicator light	Red; on when heater operating	

Dimensions



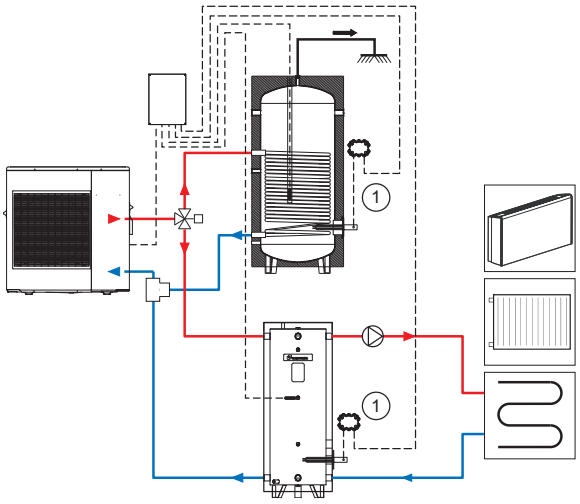
1 Terminal block cover
2 Safety thermostat manual reset
3 Control thermostat knob
4 Reference for knob full scale
5 Cable gland for control cable
6 Cable gland for power cable
7 Red light, on when the heater is operating
8 Wall fastening brackets
9 Heater body
10 Water inlet
11 Water outlet

IMMERSION ELECTRIC HEATER

The single-phase immersion electric heater can deliver 1 kW, 2k W or 3 kW depending on the electrical connections, and must only be used in immersion, via the water connections provided on the HWC storage cylinders or the BT, TP and TPS storage tanks.

The electric heater guarantees Legionella prevention or works to supplement domestic hot water production at low outside temperatures.

If used inside the TP storage tanks it can help meet building heating demand in the event of operation outside of the heat pump operating limits.

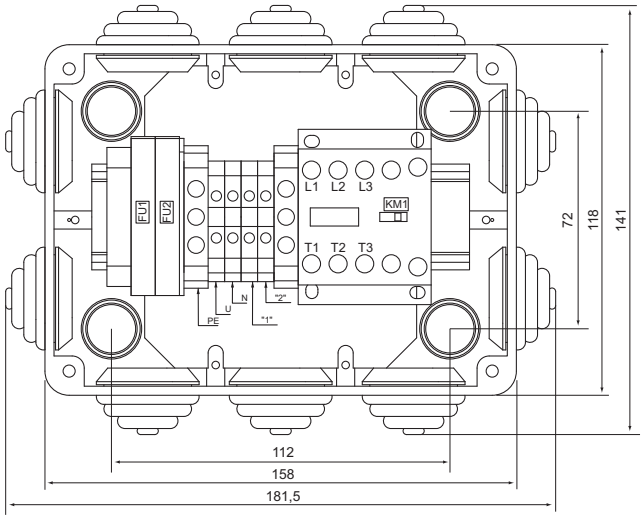


(1) Immersion electric heater

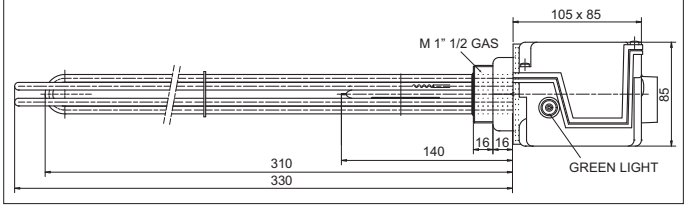
The diagram shown is purely indicative.

Technical specifications	
Power supply	230V/50Hz
Power	1000, 2000, 3000 W (+5%/ -10%); power in relation to the electrical connection.
Maximum pressure	6 Bar
Max temperature, heating area	300°C
Max temperature, seal area	120°C
Adjustable safety thermostat	9….75°C
Heating element material	Incoloy 800
Terminal block protection material	PVC
Threaded attachment	1" ½ M GAS
Gasket	ASBERIT 60*48*3
Index of protection	IP 44
Indicator light	Green; on when heater operating

Dimensions - Electrical panel



Dimensions - Immersion electric heater



1”¼ 3-WAY VALVE FOR DOMESTIC HOT WATER PRODUCTION:

The 3-way valve deviates the flow of water to the domestic hot water storage tank when the temperature read by probe BT8 falls below the set point.
The servomotor is also fitted with an auxiliary contact.
Contact closed when the valve is open and contact open when the valve is closed. The 3-way selector valve for domestic hot water production must have the following characteristics for correct heat pump operation:

- Voltage 230V AC, 50/60 Hz
- If valve rotation takes more than 10 s, the time can be set by parameter.
- Delta P 500 kPa
- Fluid temperature 0°C to 90°C
- Pressure drop below 20 kPa.

In the total height of the valve (body + servo control) also take into account 40 mm for the extension supplied with the kit, required for correct insulation of the pipes.

Technical specifications - Valve body	
Operating pressure	PN16 for water at 90°C. PN20 for chilled water
Leaks	None
Fluid temperature	Water 0°C to 90°C
Angle of rotation	90°
Thread	Gas UNI ISO 228
Valve body and fitting	Brass OT58, UNI575/65
Stem	Brass
Gasket	PTFE seat, EPDM O-ring
Ball	Chrome-plated brass
Weight	1,28 Kg

Technical specifications - Servomotor	
Power supply	230VAC, +10% - 15%
Frequency	50Hz
Power consumption	4 VA
Travel time (open/close)	10s
Free auxiliary contact (end travel)	230V - 1A (resistive)
Allowable operating temperature	0 ... + 50 °C
Allowable transport and storage temperature	- 10 ... + 80 °C
Allowable humidity	Class G, DIN 40040
Index of protection	IP 54
Connection cable	6 x1 mm², 0.8 m long
Manual control	manual open/close control
Weight	0,45 Kg

Dimensions - Valve body

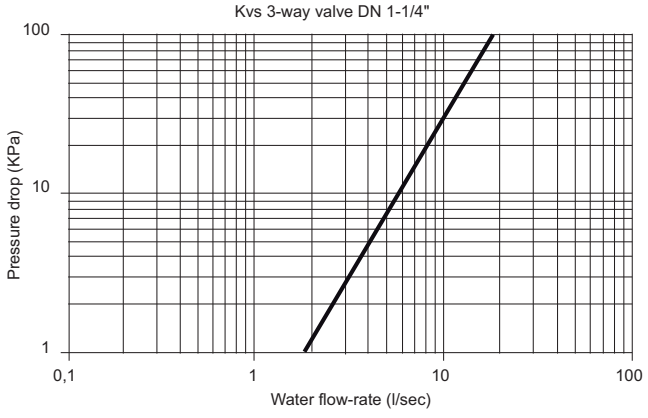
Graph of valve pressure drop



HWC DOMESTIC HOT WATER CYLINDER

The HWC storage cylinders are made especially for domestic hot water production in combination with heat pumps, thanks to the inside coil with large heat exchange area.
The heat pump is connected to the inside coil that heats the domestic hot water contained in the storage tank.
Legionella prevention cycles are managed by an electric heater that can be installed in the fitting provided on the flange.
The Legionella prevention cycles are managed by the NadiSystem controller on the heat pump.

Models available	Volume
HWC300	300 litres
HWC500	500 litres

Storage cylinder and heat pump combinations									
Storage cylinder	Coil water content	Coil surface area	Combined heat pumps						
	(l)	(m^2)	11	25	31	41	51	61	91
HWC 300	22,3	3,5	x	x	x			N.A	N.A
HWC 500	38,5	5,9	x	x	x	x	x	N.A	N.A

The combinations proposed exclude the 0061 and 0091 heat pumps, which require the TPS series storage tanks.

Technical specifications

The cylinders are made from S275JR steel plate in accordance with DIN 4753 and undergo strict water pressure tests (9 bars, allowing an operating pressure of 6 bars). Lined on the inside with double layer of enamel in accordance with DIN 4753.
Protection against corrosion guaranteed by the magnesium anode, provided with the accessories supplied as standard with the storage cylinder. The cylinders are protected on the outside by 50 mm rigid CFC-free PUR lining with white skai casing.

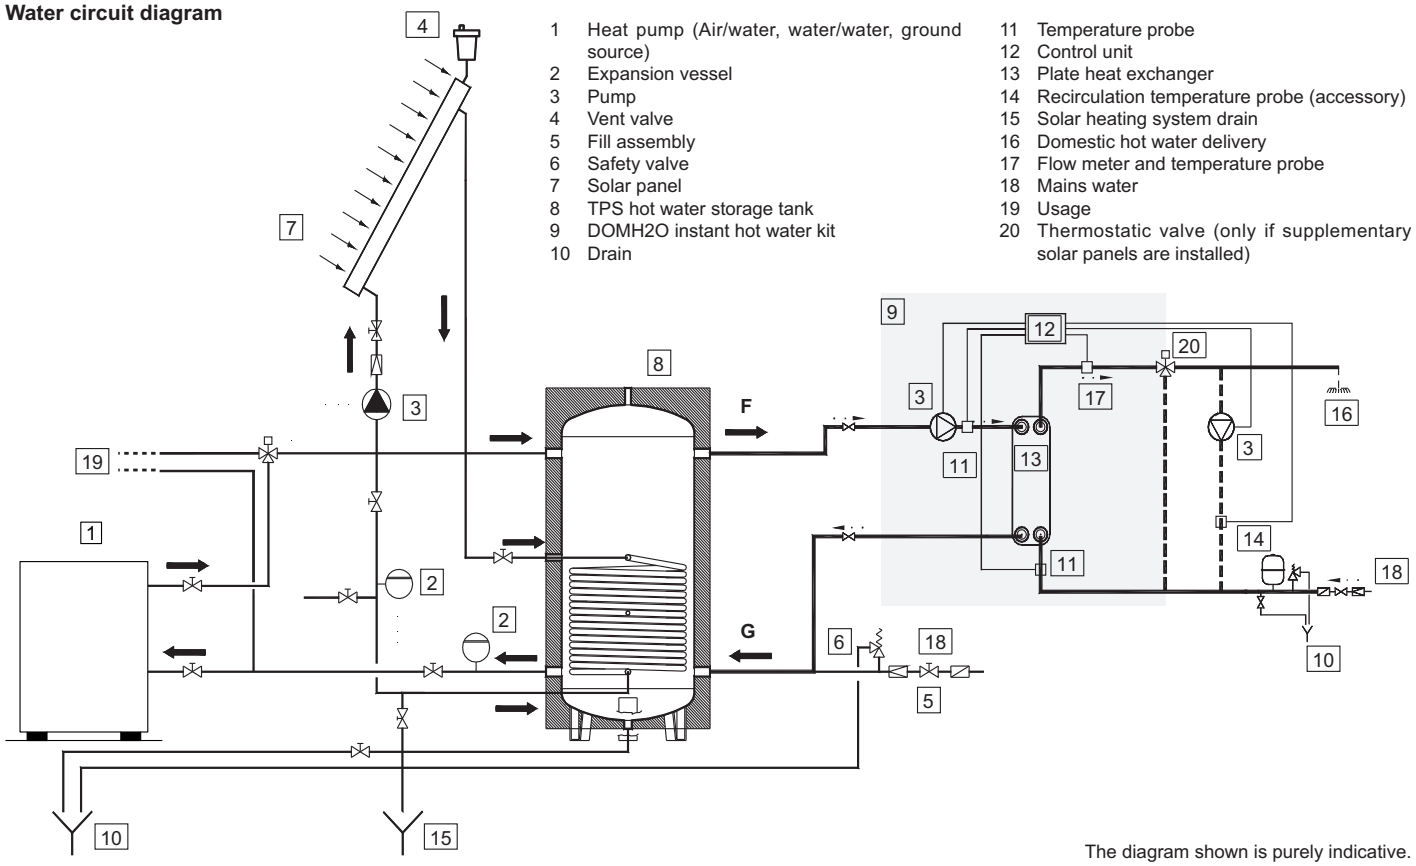
TPS STORAGE TANKS AND DOMH2O INSTANT DOMESTIC HOT WATER PRODUCTION KIT

The TPS storage tank is used to store water heated by a heat pump, and allow further supplementary heat from the solar heating coils fitted inside. In addition, tank connections are also available for other sources of heating, for example gas- or wood-fired appliances. Two electric heaters can be installed using the 2" fittings provided.
Domestic hot water production is guaranteed by the DOMH2O15 and DOMOH2O24 instant kits combined with the storage tanks.
The instant domestic hot water production kit draws energy from the storage tank and via heat exchange with the plate heat exchanger ensures the correct domestic hot water temperature, controlled by modulation of the primary circuit pump.
The control unit with graphic display allows the user to monitor operation, as well as set the set point and operating parameters.

Storage tank model available	Volume
TPS300	300 Litres
TPS500	500 Litres
TPS1000	1000 Litres

Instant domestic hot water production kit model available
DOMH20 15
DOMH20 24

Water circuit diagram



The diagram shown is purely indicative.

Technical specifications

TPS storage tanks

The storage tanks are made from carbon steel plate welded using the best technology and undergo strict water pressure tests (9 bars, allowing an operating pressure of 6 bars).
Being a container of hot and cold water, this product does not require internal treatment, while the outside is coated with rust-proof paint.
The tanks are protected on the outside with a closed cell elastomeric foam lining, 70 mm thick, with soft blue PVC exterior finish.

DOMH2O instant domestic hot water production kit

The instant domestic hot water production kit features the following components:
- AISI 316 stainless steel plate heat exchanger, insulated
- Circulating pump with low power consumption and electronic speed control
- Control unit with graphic display indicating the temperature and heat delivered
- Insulated copper pipes and connectors
- Sheet metal structure and thermoformed RAL panels, wall-mounted installation.

The control unit adjusts the speed of the primary circuit pump to maintain the set domestic hot water temperature, adjustable from 30°C to 65°C. If the domestic hot water temperature leaving the heat exchanger reaches Tmax (between 60°C and 75°C) the primary circuit pump is switched off.
When the temperature falls below the threshold (Tmax) the pump is started again.
For systems with supplementary solar heating, the primary circuit temperature may exceed the maximum limit of 65°C and pump speed modulation may not guarantee the DHW set point.

In this case, a thermostatic valve should be used at the instant domestic hot water production kit outlet to avoid excessive domestic hot water temperatures.
The DHW recirculating pump can be managed (maximum power 185 W) by setting the water temperature in the recirculation circuit.
When the temperature falls below the set point the recirculating pump is activated, and vice-versa.
In addition, on and off times can be set for the recirculation circuit and a custom program created for each day of the week.

Selection guide

To choose the best system made up of storage tank and external instant hot water production unit, the following three parameters need to be verified:

1. Tank volume is sufficient to produce the DHW required by the system.
2. Instant flow-rate of the external unit is higher than peak delivery flow-rate.
3. Storage tank volume is higher than the minimum recommended volume for correct heat pump operation (based on heat output).
   This condition is normally verified as the volume is quite low.

1. Storage tank volume

Tank volume and the characteristics of the primary source (heat output and outlet temperature) are the parameters that determine the amount of water that can be delivered in a certain unit of time. The following equation can be used to size the tank in terms of volume.

$$V = [Wf*(Tout-Tin)/(T0-Tf)] - [(P*tm*1000)/(Cp*(T0-Tf)]$$

Where:

V: Required storage tank volume in litres
Wf: Amount of domestic hot water required in the peak period, in litres
Tm: Duration of the peak period in minutes
T0: Temperature inside the storage tank [°C]
Tf: Minimum usable storage tank temperature [°C]
Tin: Mains water inlet temperature [°C]
Tout: DHW delivery temperature [°C]
Cp: Specific heat of water 4.186 kJ/kg °K
P: Primary source heat output [kW]

2. Instant DHW production

The amount of domestic hot water required at the points of delivery must be less than the amount produced by the unit.
The graphs on the previous pages illustrate the amount of water produced by the units as the primary circuit temperature changes.

3. Thermal inertia

The storage tank, as well as accumulating energy to be used when necessary, also acts as a buffer for the primary source of energy, reducing the number of starts and stops.
The volume of the storage tank must therefore be greater than the value recommended by the manufacturer of the primary source (heat pump or other appliance).

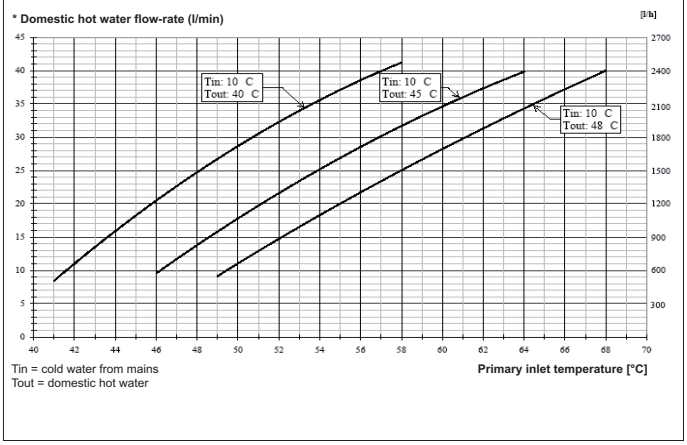
Typical combinations

Below are some combinations for typical residential applications with heat pumps.

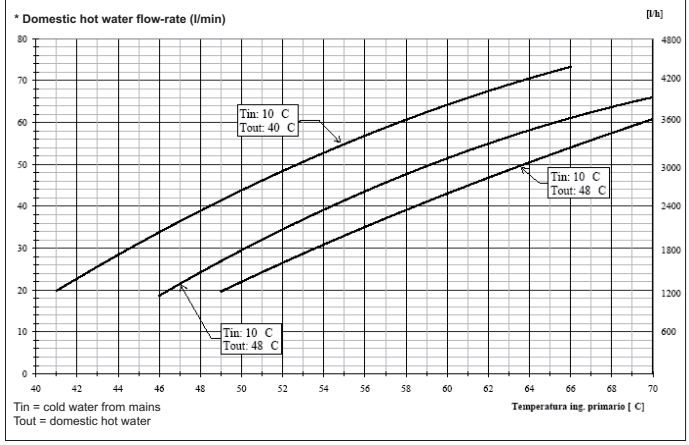
Type of home	no. of people	no. of bathrooms	Heat pump heat output	Storage tank volume	DOMH20 model
Single home	<3	1	4 - 6 kW	300	15
Single home	4 - 5	2	6 - 8 kW	500	15
Single home	5 - 6	2	10 - 13 kW	1000	24
Single home	6 - 7	3	15 - 18 kW	1000	24
2 apartments	4 - 5	2	6 - 8 kW	500	15
2 apartments	7 - 8	5	15 - 18 kW	1000	24
3 apartments	7 - 8	3	15 - 18 kW	1000	24
3 apartments	9 - 12	6	20 - 22 kW	1000	24

The combinations are calculated based on the following peak consumption:
- 60 l per person in single homes,
- 250 l per apartment with one bathroom,
- 350 l per apartment with two bathrooms,
- Simultaneous use factor

DOMH20 15 heating performance



DOMH20 24 heating performance



* The domestic hot water flow-rate shown on the performance curves remains constant for a variable time, depending on the volume of the storage tank. Also see the instructions in the "Selection guide".

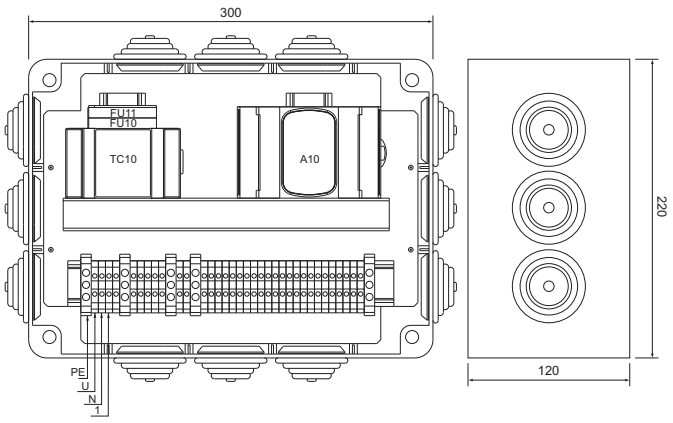
N-EM1 EXPANSION MODULE FOR SYSTEM CONFIGURATION

The NADISYSTEM control system for residential applications gives high operating flexibility, activating zone pumps and valves depending on the set room temperature, and controlling mixing valves to ensure the correct water temperature in radiant systems according to the climate conditions set for each circuit.
With NADISYSTEM there up to 15 different types of system pre-configurations for quick and easy installation, and up to 5 remote keypads for controlling thermal load in likewise zones.

The N-EM1 expansion module is used to connect the secondary circuit components and corresponding zone thermostats depending on the selected configuration.
Up to 3 expansion modules can be used to create more complex systems.
The meaning of the terminals may change based on the selected configuration, the connections are shown on the instruction sheet provided with the expansion module.

Dimensions - N-EM1 expansion module



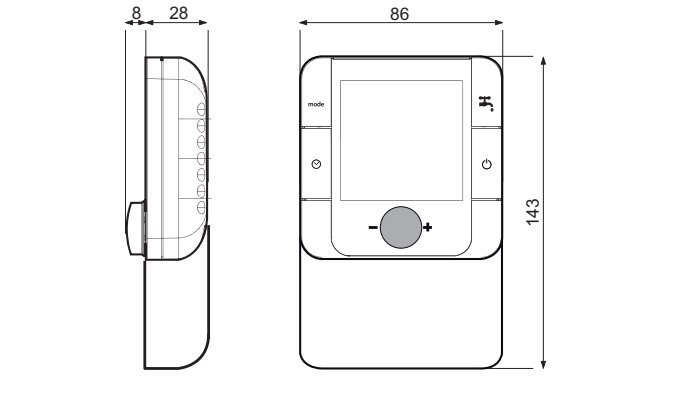
A10	Expansion module
FU10	10A fuse
FU11	1.25A fuse
TC10	230V/24V transformer

N-THC ROOM TIMER THERMOSTAT

The temperature and humidity settings are simple and intuitive using the knob on the front, while the operating mode and time bands can be selected using the 4 buttons.
The N-THC thermostat is fitted as standard with temperature and humidity probe for correct control of the temperature-humidity conditions inside the room.
By using the N-THC thermostat in the system, NadiSystem can control 5 different zones, managing temperature, humidity and time bands independently.
The simple and functional backlit display allows rapid viewing of the settings and environmental conditions.

The main settings are:
- Room temperature and humidity setting (temperature and humidity probe supplied as standard)
- Operating mode setting: heating, cooling, automatic mode changeover
- Enable domestic hot water production
- Served zone on/off
- Program time bands
- Wall-mounted installation (maximum distance 500 metres)

Dimensions



N-CM CASCADE MANAGEMENT KEYPAD

The N-CM keypad allows cascaded connection of up to 4 heat pumps to increase capacity delivered in applications with multiple occupied areas, such as hotels, schools, apartment blocks, offices and shopping centres.

The units are managed in master-slave mode, with the master unit responsible for processing the information and sending it to the slave units.

This ensures fine control over the capacity delivered, without decreasing performance, and more precise system sizing.

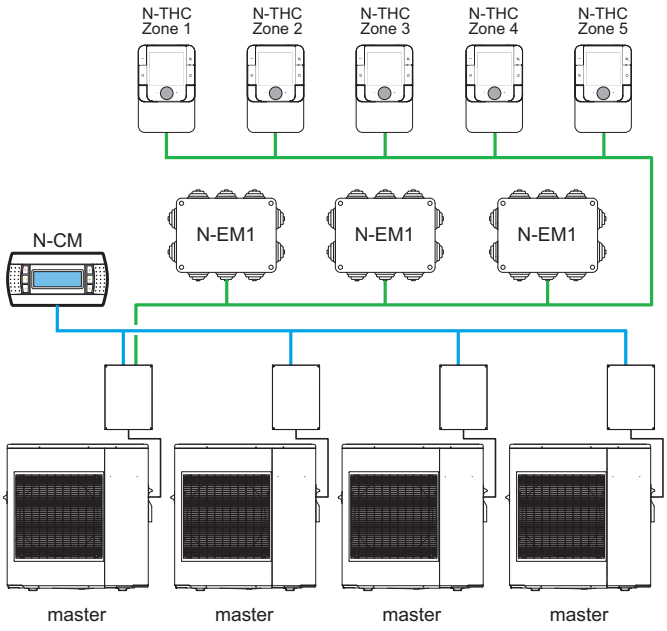
NADISYSTEM can determine how many cascaded units are needed to guarantee domestic hot water production, all or just one, according to requirements.

The controller also balances compressor operating hours based on time logic, activating the units in rotation, and where necessary excluding any units that are momentarily out of service, without interrupting operation of the cascade as a whole.

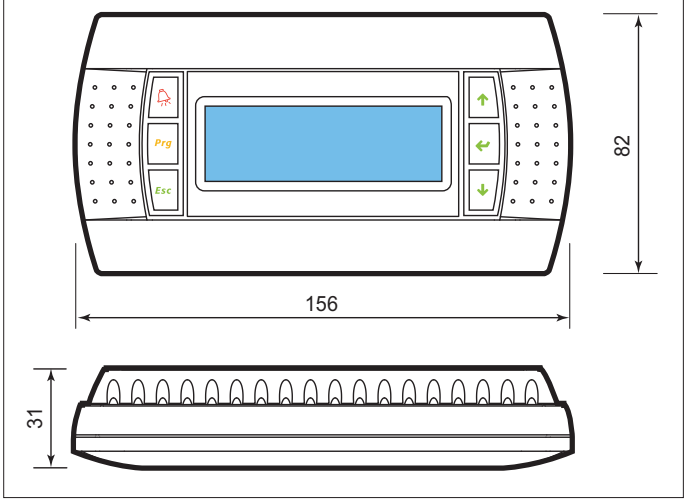
If the malfunctioning unit is the master, the operating parameters are transferred to another unit in the cascade, thus restoring partial operation.

The N-CM keypad can also display the operation of each heat pump connected to the cascade and the N-THC room terminals assigned to the zone in question, up to a maximum of 5 zones.

System architecture



Dimensions



N-RS RS485 SERIAL CARD

The N-RS is an optional card for directly interfacing the heat pumps to an RS485 network.
The card guarantees opto-isolation of the controller from the RS485 serial network.
The maximum baud rate available is 19200 baud.
The optional card is fitted in the comb connector on the unit's board.

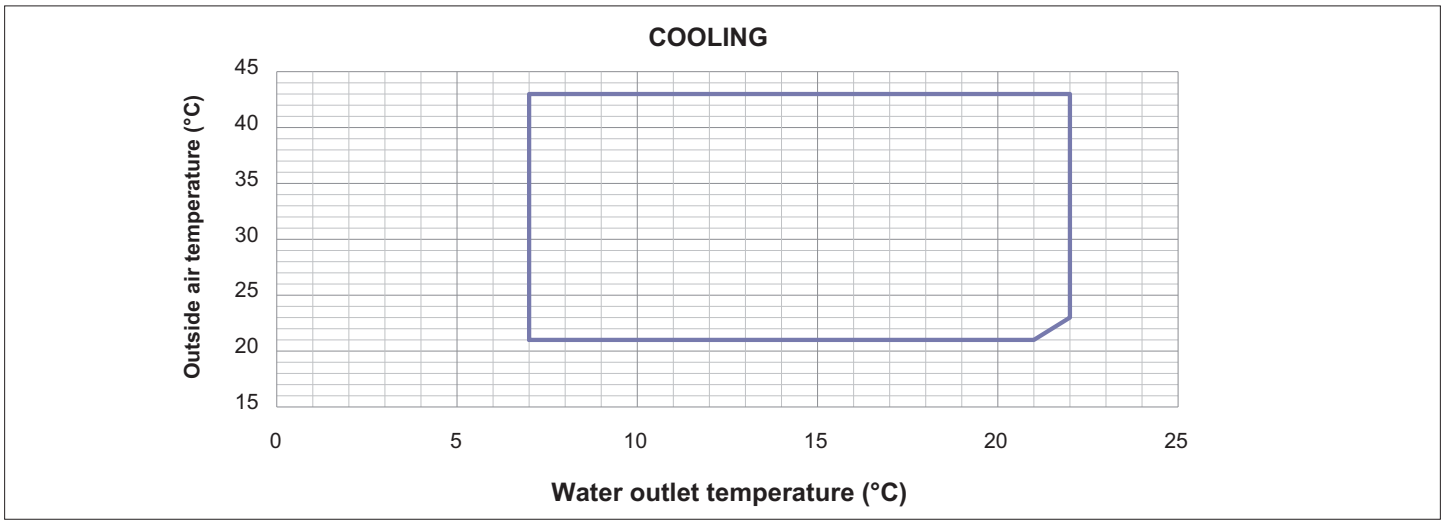
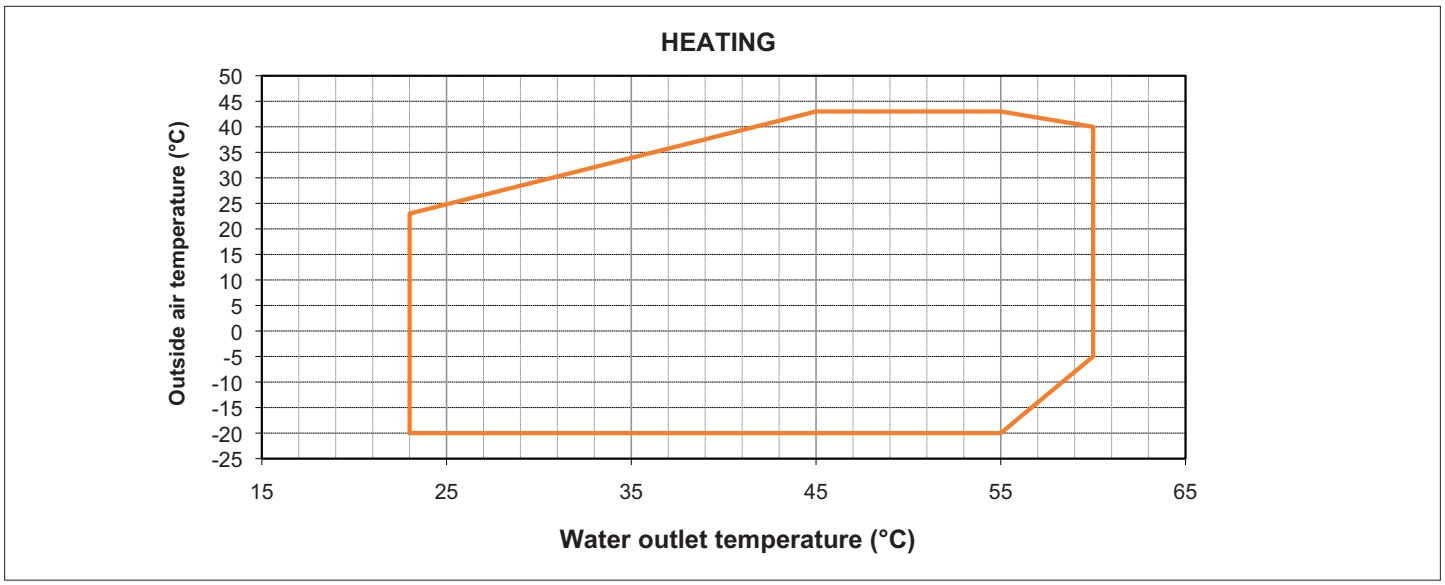
6. OPERATING LIMITS





Min/max water temperature difference = 5/10 °C (in minimum flow conditions, 7 l/min)
MAX return temperature to heat pump = 55°C
MAX outlet temperature to heat pump for DHW production = 58°C
Water circuit pressure min/max = 1/3 bar
Maximum glycol percentage = 40%

The temperature of the fluid leaving the unit must always be within the manufacturer's specified operating range, even during start-up and when first putting into heating mode. To ensure this, the water circuit can be fitted with a bypass valve and/or other solutions, such as electric heaters with temperature control inside the storage tank.

7. ETHYLENE GLYCOL MIXTURE

Ethylene glycol and water mixture, used as a heat-conveying fluid, cause a variation in unit performance. For correct data, use the factors indicated in the following tabel.

	Freezing point (°C)							
	0	-5	-10	-15	-20	-25	-30	-35
	Ethylene glycol percentage by weight							
	0	12%	20%	30%	35%	40%	45%	50%
cPf	1	0,985	0,98	0,974	0,97	0,965	0,964	0,96
cQ	1	1,02	1,04	1,075	1,11	1,14	1,17	1,2
cdp	1	1,07	1,11	1,18	1,22	1,24	1,27	1,3

cPf: cooling power correction factor
cQ: flow correction factor
cdp: pressure drop correction factor

For data concerning other kind of anti-freeze solutions (e,g, propylene glycol) please contact our Sale Department.

8. FOULING FACTORS

Performances are based on clean condition of tubes (fouling factor = 1). For different fouling values, performance should be adjusted using the correction factors shown in the following table.

FOULING FACTORS	EVAPORATOR			CONDENSER/RECOVERY			DESUPERHEATER
ff (m^2 °CW)	F1	FK1	KE [°C]	F2	FK2	KC [°C]	R3
0	1,000	1,000	0,0	1,000	1,000	0,0	1,000
1,80 x 10^{-5}	1,000	1,000	0,0	1,000	1,000	0,0	1,000
4,40 x 10^{-5}	1,000	1,000	0,0	0,990	1,030	1,0	0,990
8,80 x 10^{-5}	0,960	0,990	0,7	0,980	1,040	1,5	0,980
13,20 x 10^{-5}	0,944	0,985	1,0	0,964	1,050	2,3	0,964
17,20 x 10^{-5}	0,930	0,980	1,5	0,950	1,060	3,0	0,950

ff: fouling factors
f1 - f2: potential correction factors
fk1 - fk2: compressor power input correction factors
r3: capacity correction factors

KE: minimum condenser outlet temperature increase
KC: maximum condenser outlet temperature decrease

10. MINIMUM AND MAXIMUM SYSTEM WATER CONTENT

Minimum system water content
The minimum water content for the system shown in table 1 allows the number of compressor starts and stops to be limited.

Tab. 1	Size		0031
	Minimum water content	l	26

Maximum system water content
The heat pumps are fitted as standard with an expansion vessel and safety valve. The maximum system water content depends on the capacity of the expansion vessel (see **table 2**) and the calibration of the safety valve (see **table 3**).

Tab. 2	Size		0031
	Expansion vessel	l	8

Tab. 3	Size		0031
	Safety valve	bar	3

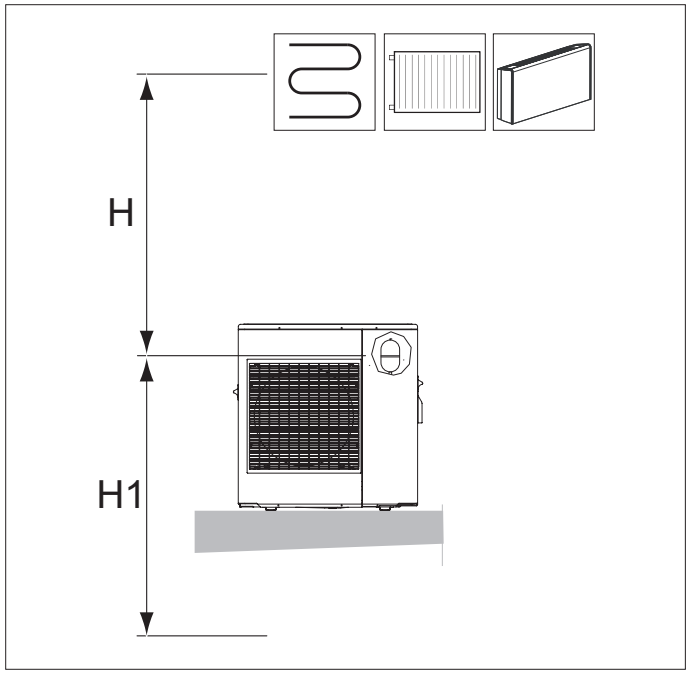
Table 4 shows an example of the maximum water content in the specified normal operating conditions.
If the volume of water in the system is higher, an additional, correctly sized expansion vessel is required.

Tab. 4							
	System water temperature	**°C**	**20**				
	Hydraulic head	m	30	25	20	15	>12,25
	Expansion vessel pre-charge	bar	3,2	2,8	2,3	1,8	1,5
	Maximum water content	l	-	277	820	1365	1665
	System water temperature	**°C**	**35**				
	Hydraulic head	m	30	25	20	15	>12,25
	Expansion vessel pre-charge	bar	3,2	2,8	2,3	1,8	1,5
	Maximum water content	l	-	85	254	420	515
	System water temperature	**°C**	**45**				
	Hydraulic head	m	30	25	20	15	>12,25
	Expansion vessel pre-charge	bar	3,2	2,8	2,3	1,8	1,5
	Maximum water content	l	-	50	150	250	305
	System water temperature	**°C**	**55**				
	Hydraulic head	m	30	25	20	15	>12,25
	Expansion vessel pre-charge	bar	3,2	2,8	2,3	1,8	1,5
	Maximum water content	l	-	34	102	170	207

Expansion vessel calibration
The expansion vessels are pre-charged to a standard pressure of 1 bar.
The pre-charge pressure is chosen depending on the maximum difference in height between the system terminal and the heat pump, as shown in the figure.

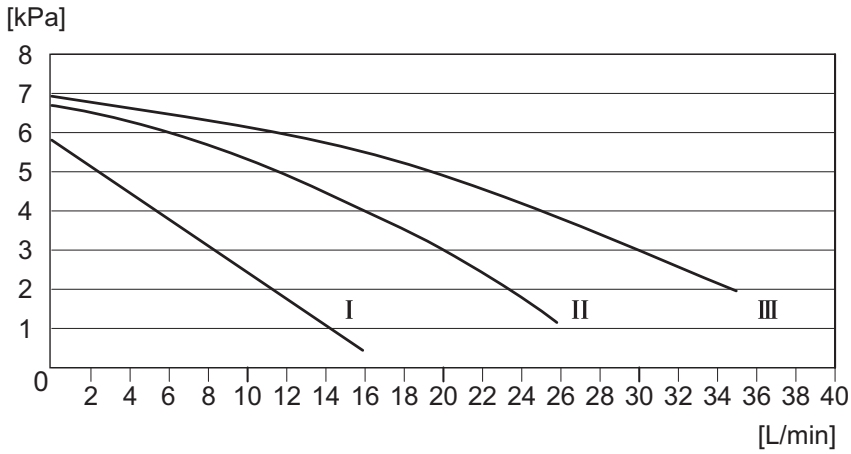
The maximum height must not exceed 55 metres due to the maximum vessel pre-charge pressure of 6 bars.

Make sure that the system terminal at the lowest point H1 can withstand the pressure of the water column at that point.



10. SYSTEM PUMP CURVES

i-KI 0031 MTD and i-KIR 0031 MTD SYSTEM PUMP CURVE



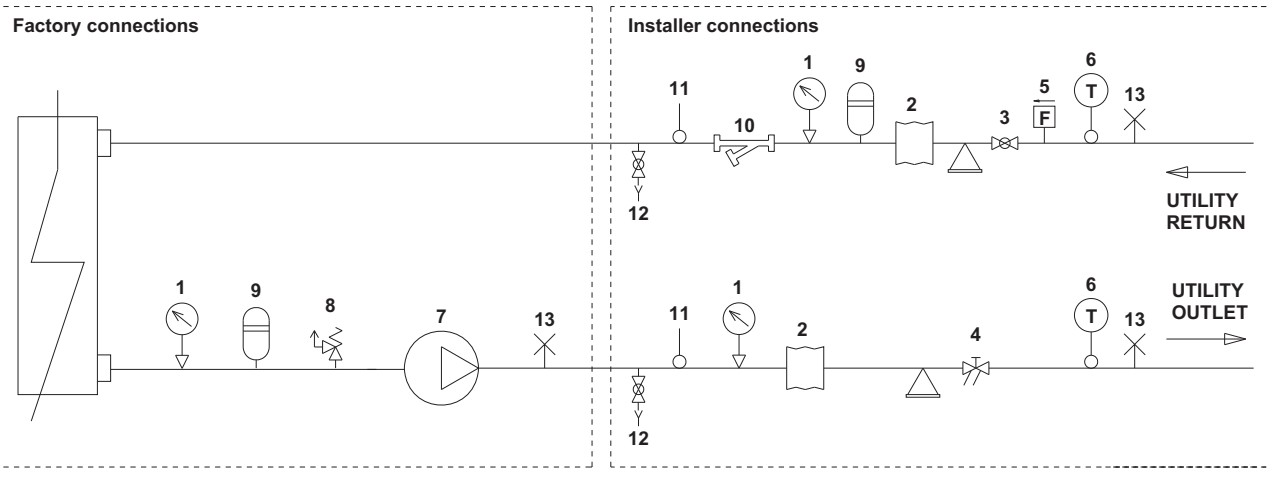
The pressure head refers to the values at the fittings.

Model	Pump power supply	Pf (1) kW	Q (1) m³/h	H (1) kPa	Pt (2) kW	Q (2) m³/h	H (2) kPa	F.L.I. kW	Pump
i-KI MTD 0031	230v-50Hz-1Ph				9,55	1,64	35	0,10	Grundfoss UPSO15-70
i-KIR MTD 0031	230v-50Hz-1Ph	7,02	1,21	49	9,55	1,64	35	0,10	Grundfoss UPSO15-70

(1) System water temperature 23/18°C, outside air temperature 35°C DB
(2) System water temperature 30/35°C, outside air temperature 7°C DB/ 6°C WB

Pf	Cooling capacity of unit
Pt	Heating capacity of unit
Q	Flow of water to evaporator
F.L.I.	Power absorbed by pump
H	Residual head

12. UTILITY WATER CIRCUIT CONNECTION DIAGRAM



1	Pressure gauge	5	Flow switch (obligatory)	9	Expansion vessel	13	System vent
2	Vibration damper joint	6	Thermometer	10	Wire mesh filter		
3	Shut off valve	7	Pump	11	Temperature sensor		
4	Calibrating valve	8	Safety valve	12	Unit fill/drain valve		

12. FULL LOAD SOUND LEVEL

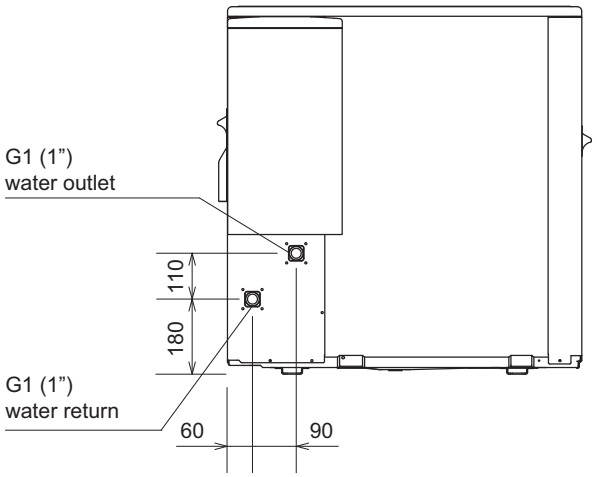
SOUND POWER									
SIZE	Octave band [Hz]								Total sound level
	63	125	250	500	1000	2000	4000	8000	
	Sound power level dB(A)								
i-KIR 0031m	64	64	64	62	60	53	50	39	64
i-KI 0031m	64	64	64	62	60	53	50	39	64

Working conditions
Plant (side) cooling exchanger water (in/out) 12/7 °C
Heat exchanger air (in) 35 °C
Sound power on the basis of measurements made in compliance with ISO 9614 and Eurovent 8/1 for Eurovent certified units; in compliance with ISO 3744 for non-certified units
Such certification refers specifically to the sound Power Level in dB(A). This is therefore the only acoustic data to be considered as binding.

SOUND PRESSURE LEVEL									
SIZE	Octave band [Hz] at 1 m								Total sound level
	63	125	250	500	1000	2000	4000	8000	
	Sound pressure level dB(A)								
i-KIR 0031m	50	50	50	48	46	39	36	25	50
i-KI 0031m	50	50	50	48	46	39	36	25	50

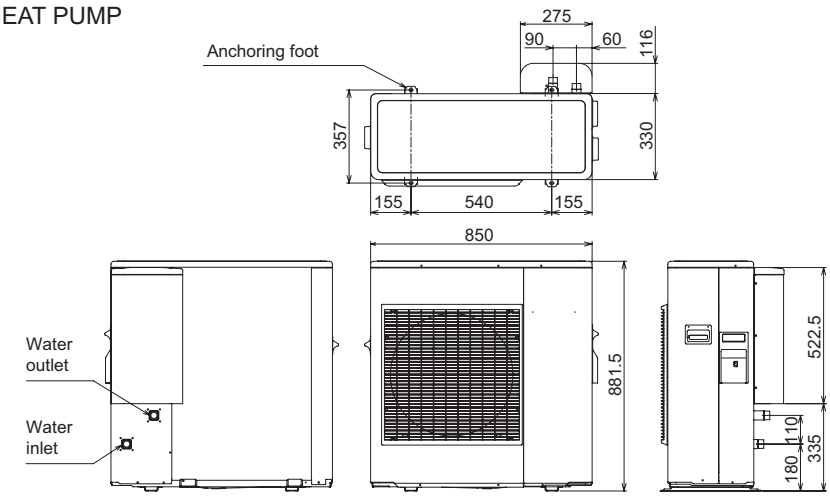
Working conditions
Plant (side) cooling exchanger water (in/out) 12/7 °C
Heat exchanger air (in) 35 °C
Average sound pressure level, at 1 (m.) distance, unit in a free field on a reflective surface; non-binding value obtained from the sound power level.

13. POSITION OF THE WATER CONNECTIONS

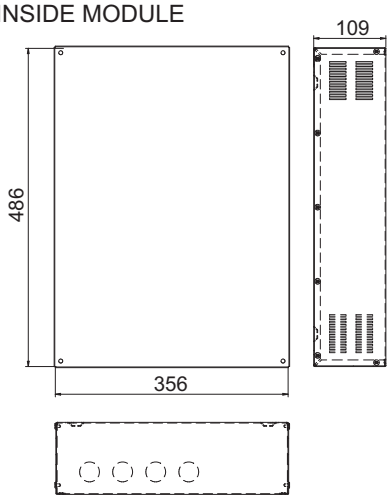


16. DIMENSIONAL DRAWINGS

HEAT PUMP

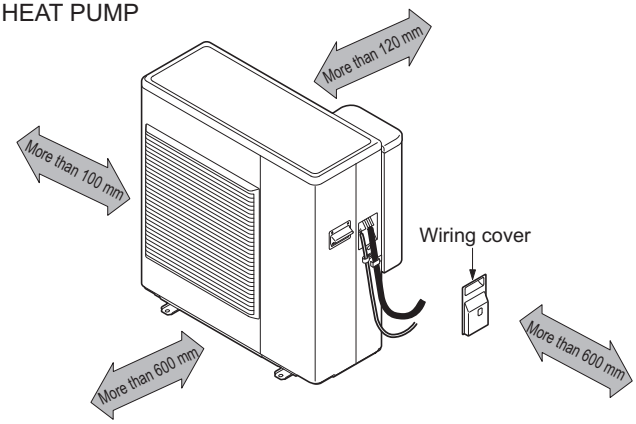


INSIDE MODULE

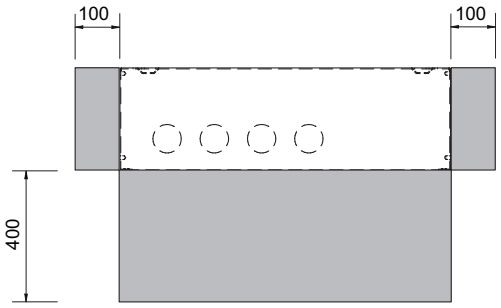


15. CLEARANCES - HOISTING

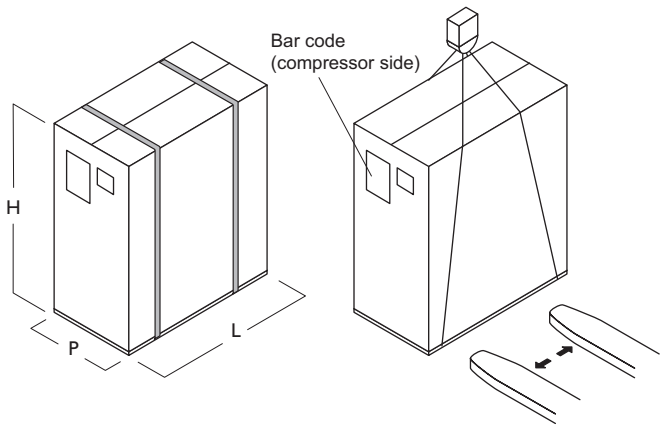
HEAT PUMP



INSIDE MODULE



HEAT PUMP



i-KI/i-KIR Dimensions		0031m
Dimension L	mm	1040
Dimension P	mm	550
Dimension H	mm	940

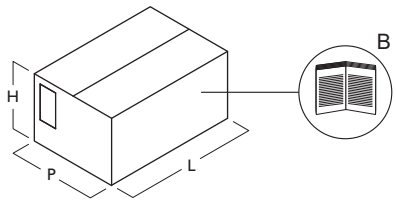
INSIDE MODULE



i-EM/i-EMR Dimensions		0031m
Dimension L	mm	600
Dimension P	mm	400
Dimension H	mm	300
Gross weight	Kg	12

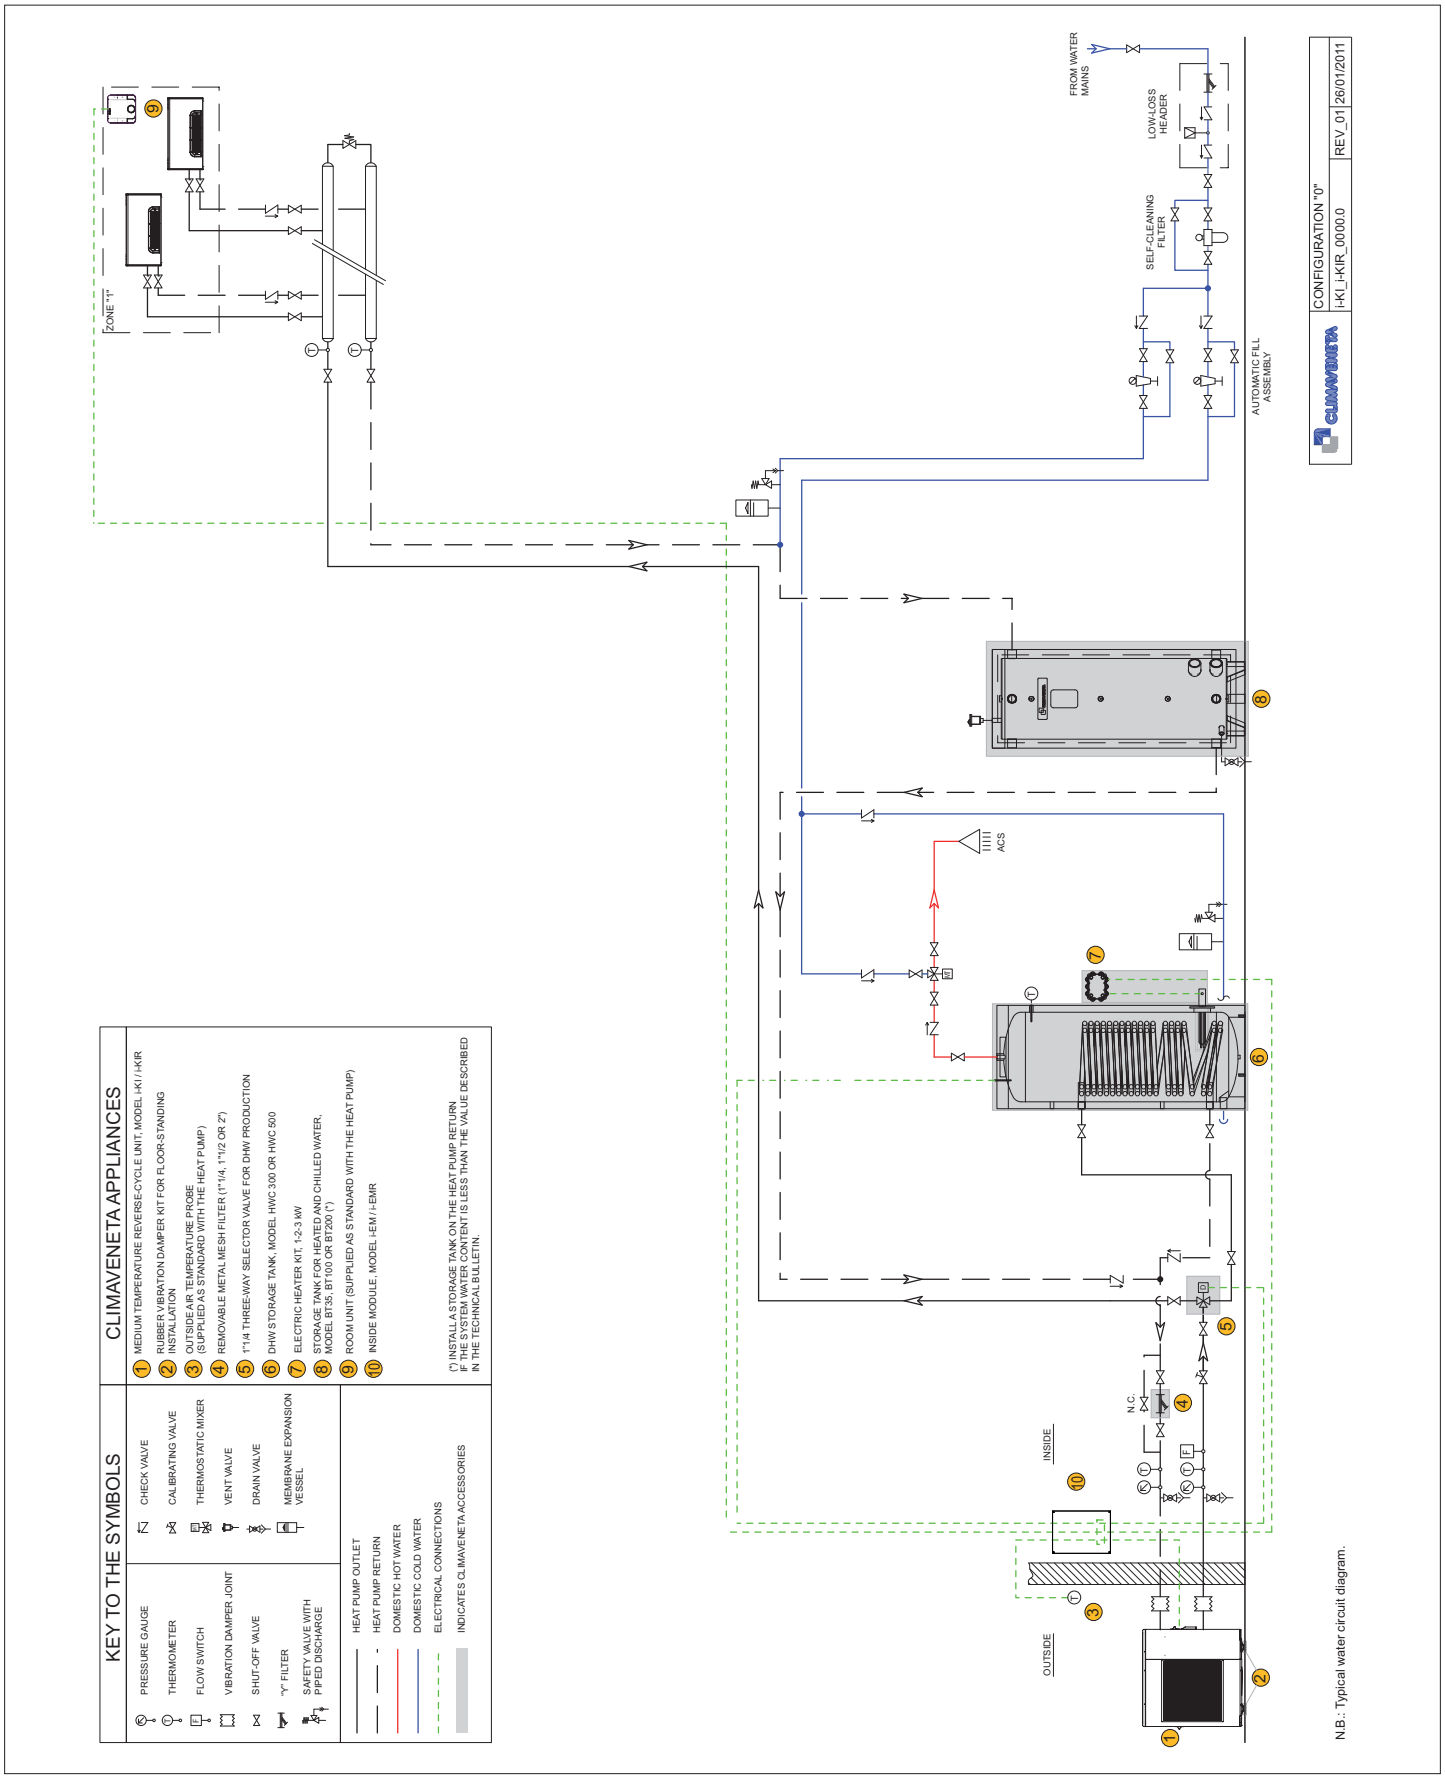
HOISTING INSTRUCTIONS

- Make sure all the panels are securely fastened before handling the unit.
- Before hoisting, check the weight of the unit on the CE rating label.
- Use all of the hoisting points indicated, and no others,
- Use equal length cables or slings.
- Use a spreader bar (not included)
- Handle the unit with care and without sudden or jerky movements.

16. OPERATING DIAGRAMS

Heat pump connection to the system without low-loss header. Make sure the useful pressure head of the circulating pump on the unit is sufficient for the pressure drop in the system. If the minimum system content does not reach values shown in this manual, install an additional storage tank on the heat pump return pipe. No system configurations are required.

Water circuit diagram



CLIMAVENETA APPLIANCES
1 MEDIUM TEMPERATURE REVERSE-CYCLE UNIT, MODEL i-KI / i-KIR
2 RUBBER VIBRATION DAMPER KIT FOR FLOOR-STANDING INSTALLATION
3 OUTSIDE AIR TEMPERATURE PROBE (SUPPLIED AS STANDARD WITH THE HEAT PUMP)
4 REMOVABLE METAL MESH FILTER (1"1/4, 1"1/2 OR 2")
5 1"1/4 THREE-WAY SELECTOR VALVE FOR DHW PRODUCTION
6 DHW STORAGE TANK, MODEL HWC 300 OR HWC 500
7 ELECTRIC HEATER KIT, 1-2-3 kW
8 STORAGE TANK FOR HEATED AND CHILLED WATER, MODEL BT35, BT100 OR BT200 (*)
9 ROOM UNIT (SUPPLIED AS STANDARD WITH THE HEAT PUMP)
10 INSIDE MODULE, MODEL i-EM / i-EMR
(*) INSTALL A STORAGE TANK ON THE HEAT PUMP RETURN IF THE SYSTEM WATER CONTENT IS LESS THAN THE VALUE DESCRIBED IN THE TECHNICAL BULLETIN.

WATER CIRCUIT DIAGRAM

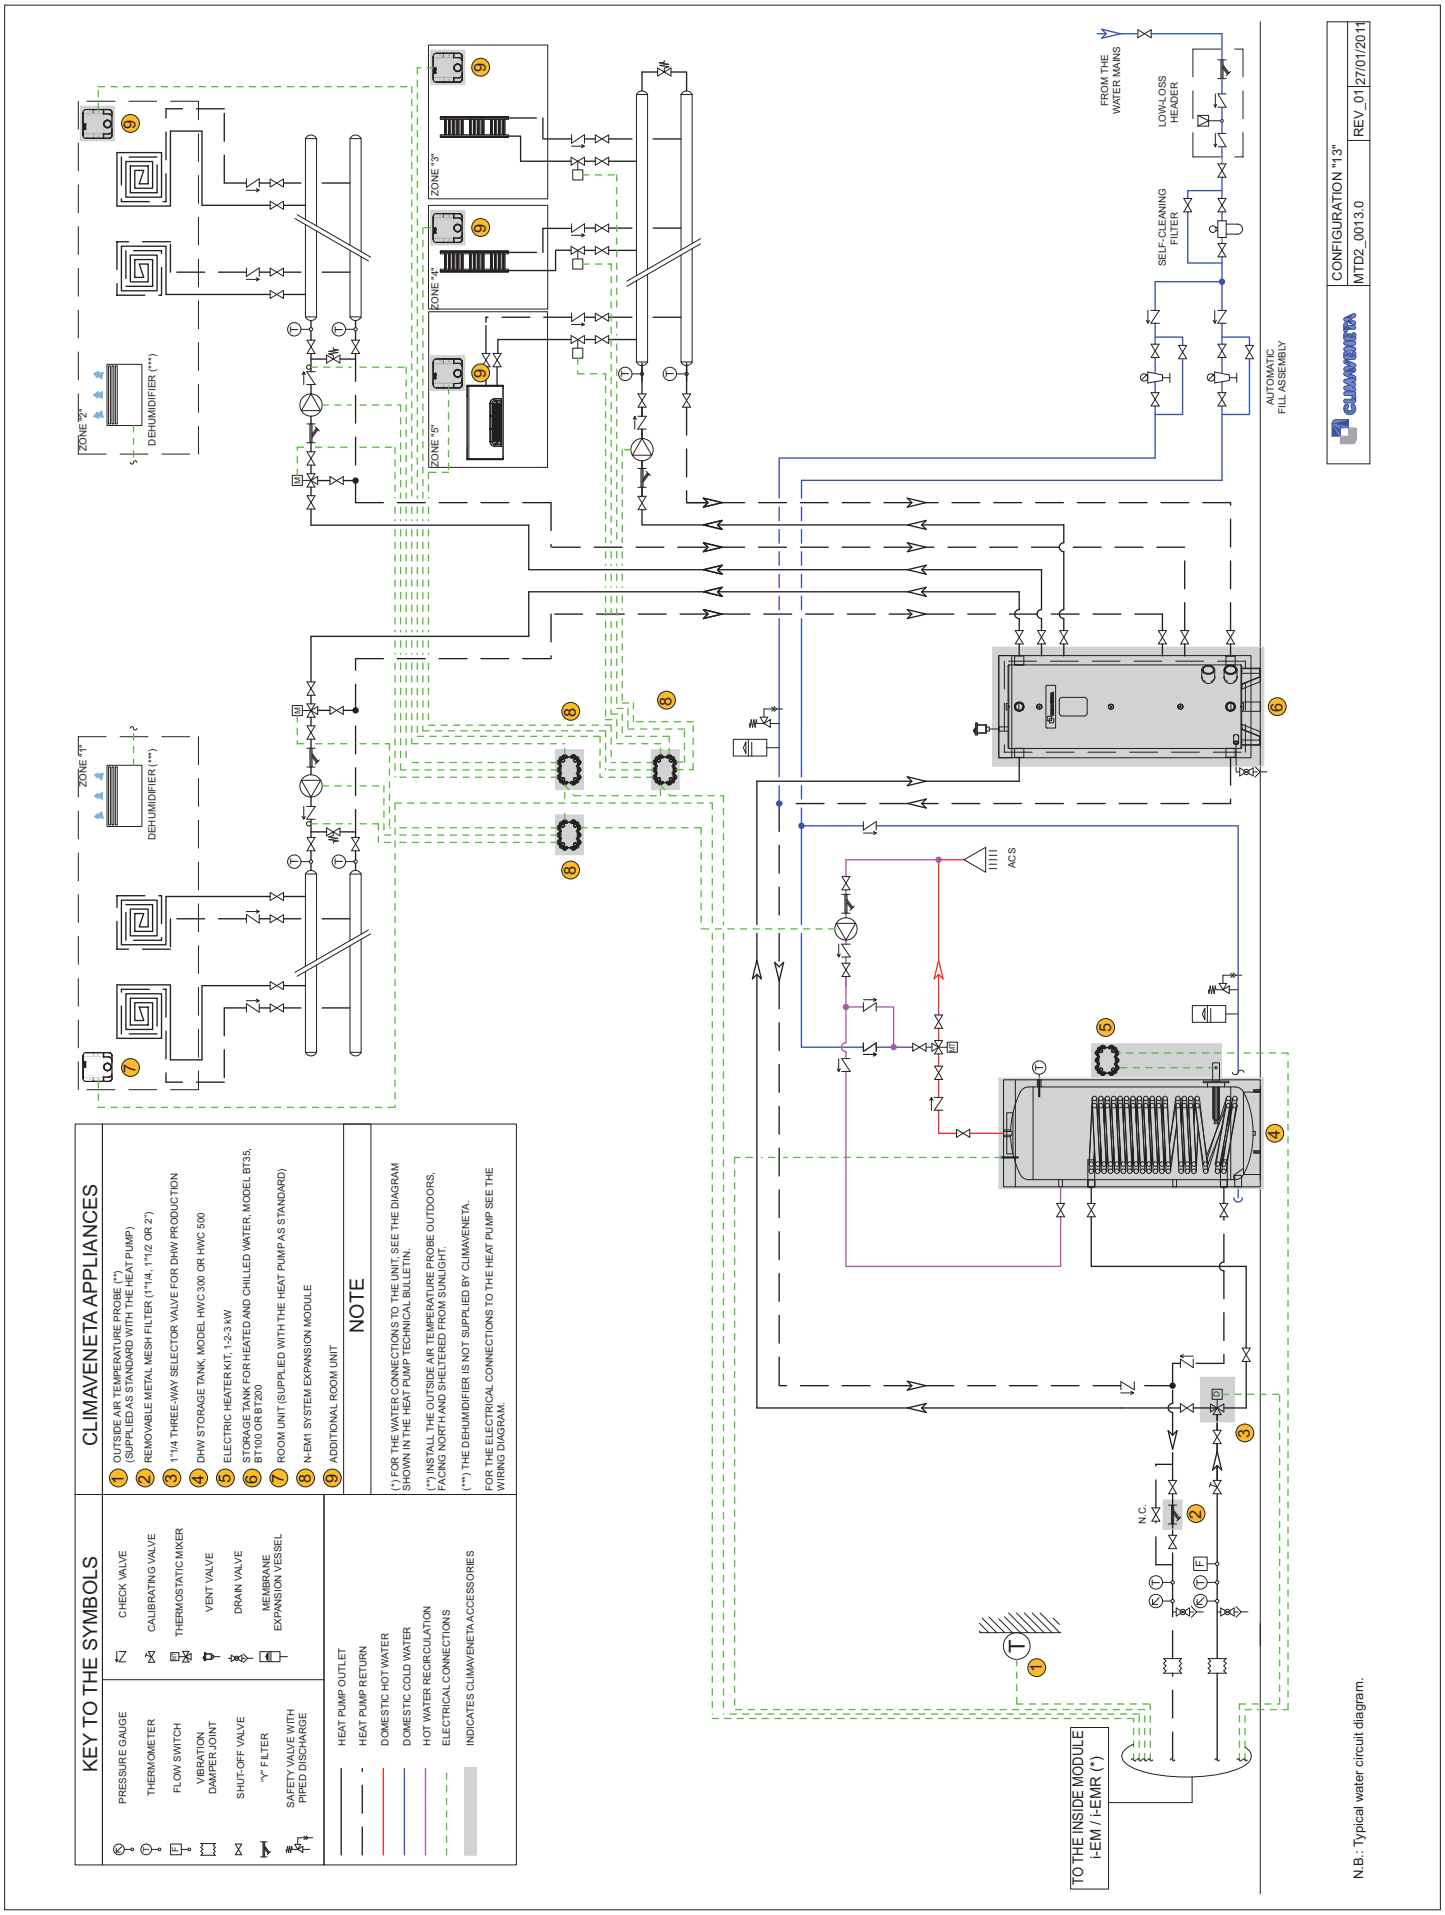
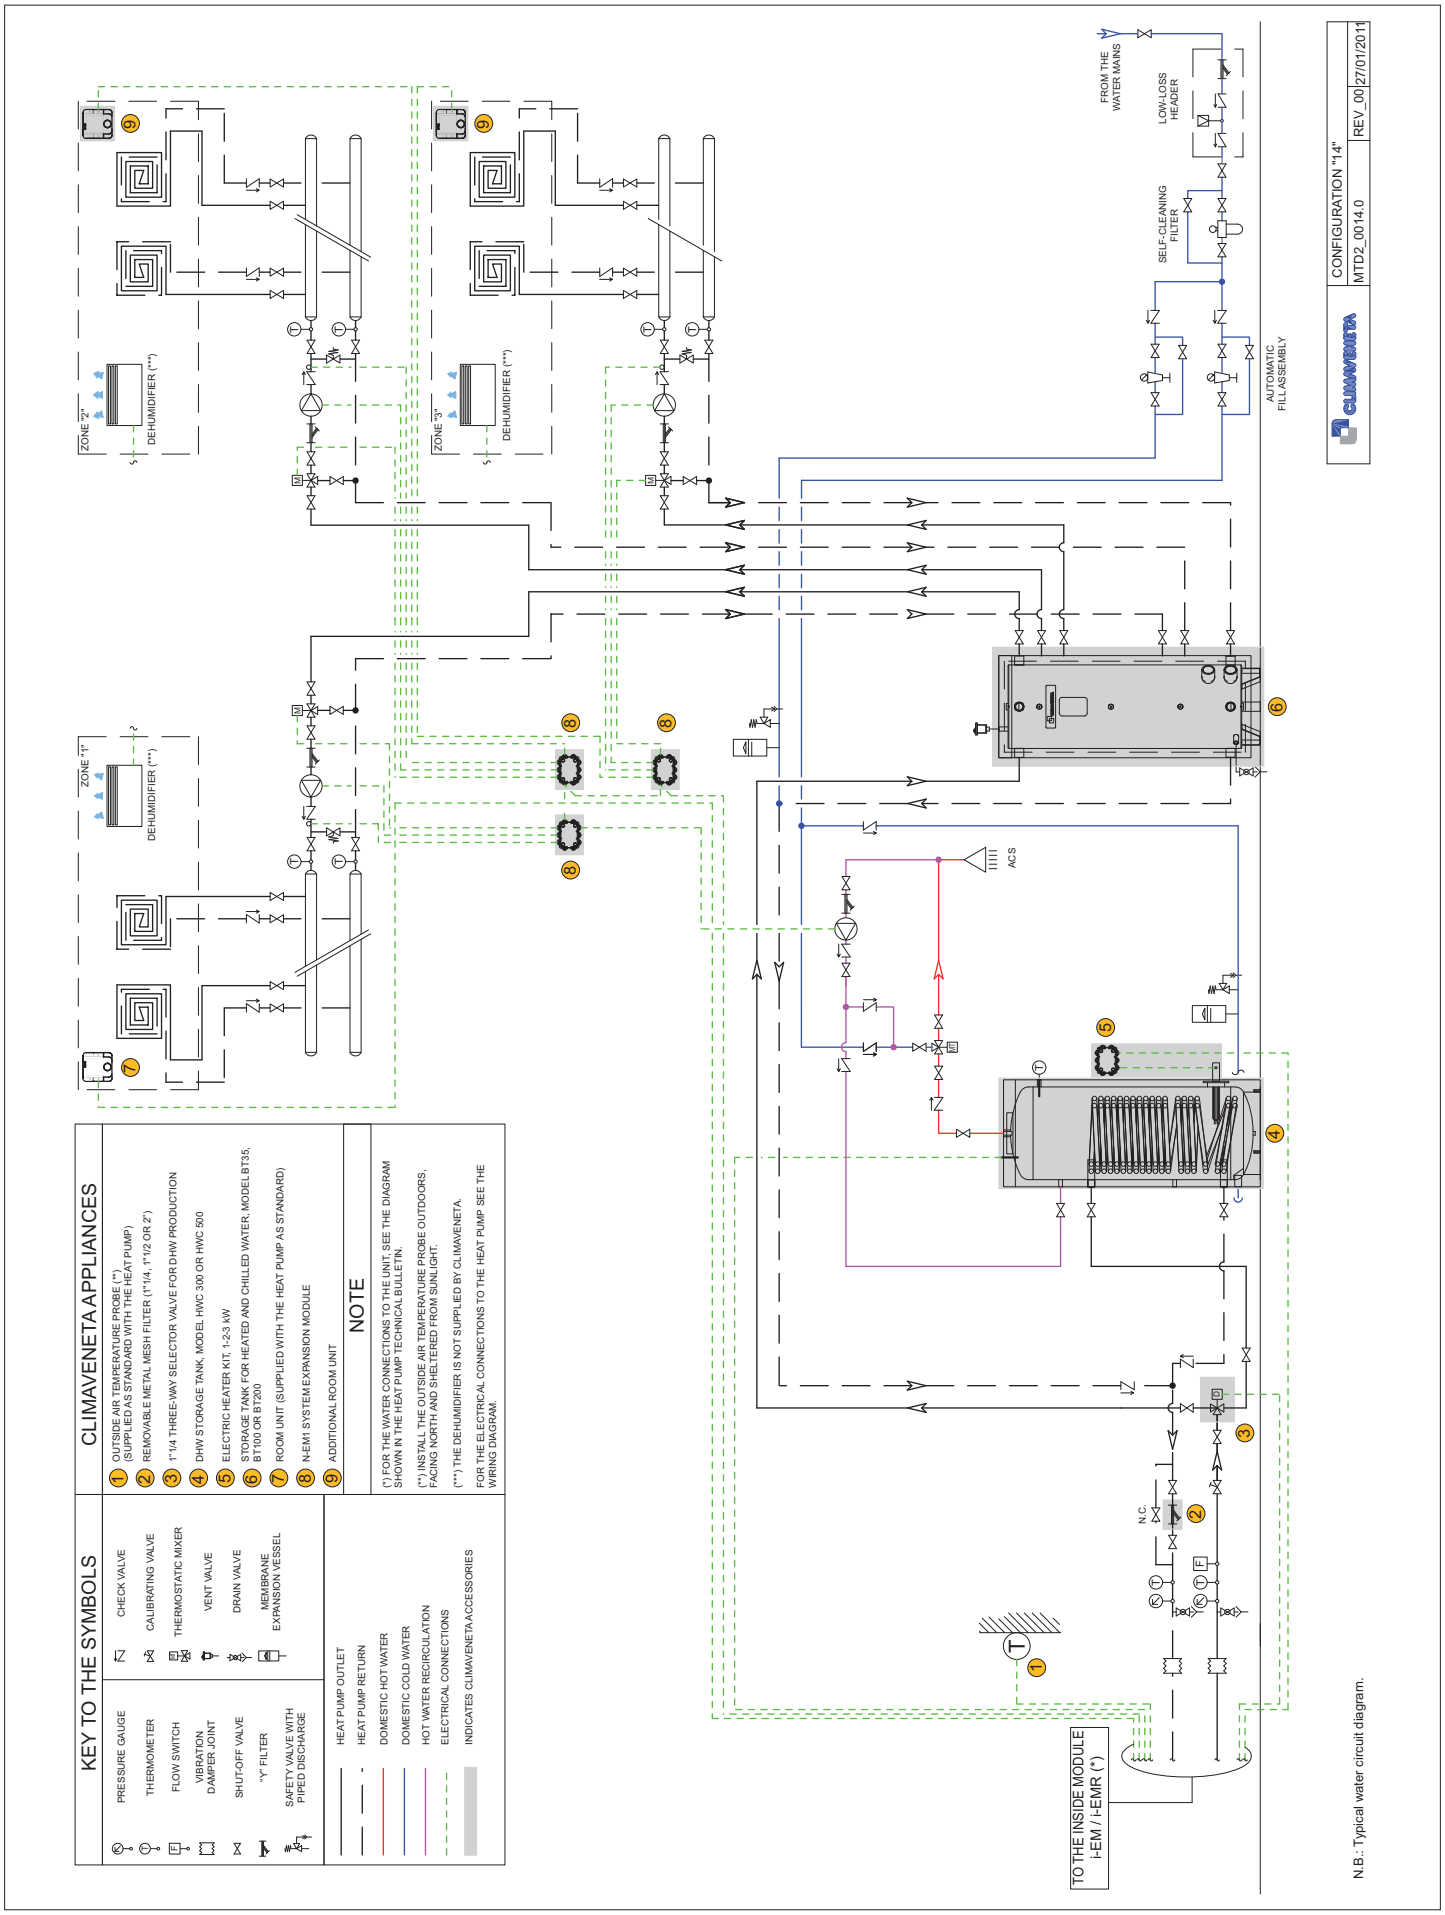
Configuration number 13 (parameter 0101= 13)



KEY TO THE SYMBOLS
PRESSURE GAUGE
THERMOMETER
FLOW SWITCH
VIBRATION DAMPER JOINT
SHUT-OFF VALVE
"Y" FILTER
SAFETY VALVE WITH PIPED DISCHARGE
CHECK VALVE
CALIBRATING VALVE
THERMOSTATIC MIXER
VENT VALVE
DRAIN VALVE
MEMBRANE EXPANSION VESSEL
HEAT PUMP OUTLET
HEAT PUMP RETURN
DOMESTIC HOT WATER
DOMESTIC COLD WATER
HOT WATER RECIRCULATION
ELECTRICAL CONNECTIONS
INDICATES CLIMAVENETA ACCESSORIES
CLIMAVENETA APPLIANCES
1 OUTSIDE AIR TEMPERATURE PROBE (*) (SUPPLIED AS STANDARD WITH THE HEAT PUMP)
2 REMOVABLE METAL MESH FILTER (1"1/4, 1"1/2, OR 2")
3 1"1/4 THREE-WAY SELECTOR VALVE FOR DHW PRODUCTION
4 DHW STORAGE TANK, MODEL HWC 300 OR HWC 500
5 ELECTRIC HEATER KIT, 1-2-3 kW
6 STORAGE TANK FOR HEATED AND CHILLED WATER, MODEL BT35, BT100 OR BT200
7 ROOM UNIT (SUPPLIED WITH THE HEAT PUMP AS STANDARD)
8 N-EM1 SYSTEM EXPANSION MODULE
9 ADDITIONAL ROOM UNIT
NOTE
(*) FOR THE WATER CONNECTIONS TO THE UNIT, SEE THE DIAGRAM SHOWN IN THE HEAT PUMP TECHNICAL BULLETIN.
(**) INSTALL THE OUTSIDE AIR TEMPERATURE PROBE OUTDOORS, FACING NORTH AND SHELTERED FROM SUNLIGHT.
(***) THE DEHUMIDIFIER IS NOT SUPPLIED BY CLIMAVENETA.
FOR THE ELECTRICAL CONNECTIONS TO THE HEAT PUMP SEE THE WIRING DIAGRAM.
ZONE "1"
ZONE "2"
ZONE "3"
ZONE "4"
ZONE "5"
DEHUMIDIFIER (***)
FROM THE WATER MAINS
LOW-LOSS HEADER
SELF-CLEANING FILTER
AUTOMATIC FILL ASSEMBLY
ACS
N.C.
TO THE INSIDE MODULE i-EM / i-EMR (*)
CONFIGURATION "13"
MTD2_0013.0
REV_01 27/01/2011
N.B.: Typical water circuit diagram.

WATER CIRCUIT DIAGRAM

Configuration number 14 (parameter 0101= 14)



KEY TO THE SYMBOLS
PRESSURE GAUGE
THERMOMETER
FLOW SWITCH
VIBRATION DAMPER JOINT
SHUT-OFF VALVE
"Y" FILTER
SAFETY VALVE WITH PIPED DISCHARGE
CHECK VALVE
CALIBRATING VALVE
THERMOSTATIC MIXER
